Overview of production line

HEW has been producing asynchronous motors for more than 120 years. Our product line comprises the following variants:

- Standard 3-phase motors
- Standard pole-changing 3-phase motors
- Standard pole-changing 3-phase motors , fan drives
- Reluctance motors
- Single-phase motors
- Brake motors
- Rotating field motors
- Submersible motors
- Hygiene motors
- Explosion protected three-phase motors for use in Zone 2
- Explosion protected three-phase (brake) motors for use in Zone 22
- Explosion protected three-phase motors (see catalogue part Model series DEx)
- Explosion protected three-phase brake motors (see catalogue part Model series DEx)

Due to their high-quality insulation system, our motors are suited for inverter operation.
They are always manufactured in thermal class F and can be equipped with PTC or thermostatic switch.
(Other temperature monitoring elements are available on request..)

Operating three-phase motors in demanding drive systems often requires feedback elements to be fitted.
On customer's request, HEW also supplies the motors with rotary encoders from various manufacturers. Tachometers, resolvers or sensor bearings are available on request.
Three-phase motors or three-phase brake motors can be equipped with such encoders.

Standard motors come in protection class IP 54. Higher protection levels are available on request
(see page 1/6).

Versions in compliance with other standards or guidelines (e.g. UL/CSA, VIK or GL) are available on request.

Primer/paint

HEW motors are provided with a primer as standard. The primer is a low-solvent two-component polyacrylic product. The quick-drying primer coat can be applied as an undercoat, primer or primer filler to all metallic surfaces.

On customer's request, the motors are available with a two-component polyacrylic paint (acc. to RAL table). Special paint coats for extreme environmental conditions are also available on request.

Efficiencies

Longevity, safety and environmental compatibility have always been part of our company philosophy. This is why careful and responsible handling of resources led to the development of energy-saving motors and drive solutions at an early stage.

Due to the introduction of EU directive (EC) 640 / 2009, the energy efficiency of electric motors is becoming increasingly important.

This directive specifies binding deadlines at which new motors must comply with the respective efficiency class. In Europe, the first part of this standard was put into effect on June 16 2011, which means that motors with efficiency classes falling below those stipulated by the standard may no longer be supplied. Other country-specific rules must also be heeded.

IEC 60034-30

As of August 1 2009, the IEC 60034-30 standard applies to the internationally unique classification of efficiencies of three-phase squirrel cage asynchronous motors. Please note that at present only classes IE1 to IE3 are standardised. Class IE4 is in the proposal state right now but is expected to be specified in a future issue of IEC 60034-30. According to information available today, losses are to be 15 % lower than the losses of class IE3. But this will be specified in a future issue of the standard.

The regulations will apply to three-phase 50 Hz or 50 / 60 Hz squirrel cage motors with 2, 4 or 6 poles whose

- maximum nominal voltage UN is 1000 V
- nominal power ranges from 0.75 kW to 375 kW
- design is suitable for operating mode S1 and S3 > 80 % acc. to IEC 60034-1

Exceptions acc. to IEC 60034-30 apply to:

- motors fully integrated into a machine (e.g. pumps, fans and compressors) that cannot be tested separately
- motors with cooling fluid temperatures at the product inlet of below 0 °C or above 32 °C (e.g. water cooled motors)
- motors with nominal voltages > 1000 V
- built-in motors
- motors operated at > 4000 m above sea level
- motors operated at ambient temperatures above 60 °C and below -15 °C
- multi-speed motors (pole-changing motors)

The exceptions acc. to the EuP directive also apply to:

- brake motors
- motors for use in explosive areas acc. to directive 94 / 9 / EC
- motors with operating temperatures > 400 °C (e.g. flue gas fans)

Other country-specific rules must also be heeded. This directive contains a mandatory schedule defining when each of the efficiency classes are to become effective as statutory minimum efficiency classes. Motor not complying with the applicable efficiency class at a given time must then no longer be sold. Please note that motors with the same power must be more efficient at 60 Hz and therefore require a special design.

Although not yet required for explosion protected motors, our motors comply with the efficiency requirements of IEC 60034-30 even today. The following motors are currently available:

- Size 80 – 225 in 2-pole design with a nominal voltage/frequency of 400 V / 50 Hz – IE2 version
- Size 80 – 225 in 4-pole design with a nominal voltage/frequency of 400 V / 50 Hz – IE2 version

The type designation of these motors contains the letter "H", the appropriate IE efficiency class and the efficiency, e.g. DEx 100LH/4K - IE2-85.2%.

For more information, please refer to catalogue part DEx motor on pages 18/1-2.

Standards and regulations

The motors comply with commonly applicable standards and regulations, in particular:

Protection classes

DIN EN 60034-5 (VDE 0530-5) identifies the protection classes of rotating electrical machines with a code comprised of the code letters IP (International Protection) and two code numbers.

1st code number (0 to 6): protection levels for protection against contact and foreign objects.

2nd code number (0 to 8): protection levels for protection against water.

HEW standard motors come in protection class IP 54.

The following table lists the protection classes for electric motors.

Protection class IP5X against dust the the most common one. Other protection classes are available on request.

Protection class	1st code number	2nd code number
	Protection against contact and foreign objects.	Protection against water
IP 54		Water being sprayed onto the machine from all directions must not have any detrimental effect.
IP 55	Protection against contact with and approaching live parts as well as contact with moving parts inside the housing. The ingress of dust is not entirely prevented but dust cannot enter in amounts that would impair the satisfactory operation of the machine.	Water being sprayed onto the machine with a nozzle from all directions must not have any detrimental effect.
IP 56		Harmful amounts of water by heavy seas or water in a powerful jet must not enter the housing.

To prevent foreign objects from falling into the motor, the fan cowl can be equipped with a protective roof. This is particularly useful for all versions where the shaft end points down (e.g. V1 / V5 / V18).

Housing version

The housings of sizes 63 to 160 are made of an aluminium alloy. The housings of sizes 180 are made of cast iron.

Contrary to the standard range, sizes 80-160 are available in cast iron (on request).

Flange variants

Available flanges

Designation of as per DIN EN 50347	FF100	FF115	FF130	FF165	FF215	FF265	FF300

Size 160							o	x

x = Assignment as per standard (DIN EN 50347)

o = Special flange

Other flange variants available on request

Note

Designation of as per DIN 50347

FF – Flange with through holes

FF corresponds to bolt circle diameter M of fastening bores

FT – Flange with threaded holes

FT corresponds to bolt circle diameter M of fastening threads

Old designation as per DIN 42948

A corresponds to the outer flange diameter of flange B5

C corresponds to the outer flange diameter of flange B14

Storage

HEW motors of sizes 63 to 180 are equipped with grooved ball bearings acc. to DIN 625 at the drive side (DS) and on the non-driving side (NS). The NS bearing of size 132 to 180 motors is a fixed bearing. For protection class IP 54, 2Z bearings with C3 bearing play are used. As of protection class IP 55, 2RS bearings with C3 bearing play are used. The DS bearing is a floating bearing held in place with ball spacer washers.

Standard bearing assignment

Size	DS bearing	NS bearing
63	6202 2Z C3	6202 2Z C3
71	6202 2Z C3	6202 2Z C3
80	6204 2Z C3	6204 2Z C3
90	6205 2Z C3	6205 2Z C3
100	6206 2Z C3	6206 2Z C3
112	6306 2Z C3	6306 2Z C3
132	6308 2Z C3	6308 2Z C3 (fixed bearing)
160	6309 2Z C3	6309 2Z C3 (fixed bearing)
180	6310 2Z C3	6310 2Z C3 (fixed bearing)

Bearing lubrication

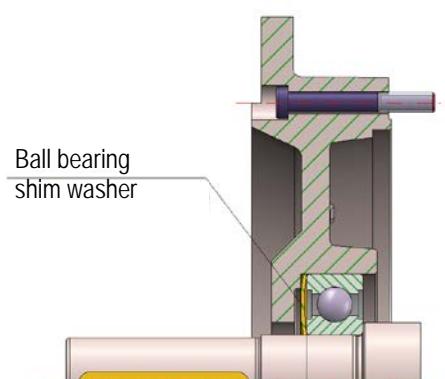

The motors are fitted with permanently lubricated bearings. When subjected to the maximum permissible load, the nominal service life of a bearing is at least 20 000 h.

Using cylindrical roller bearings

Cylindrical roller bearings can be fitted on request if the permissible radial forces are exceeded (see the following table).

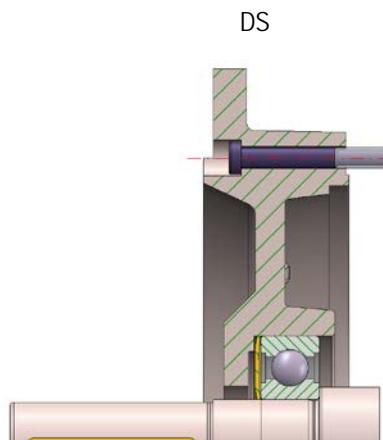

Bearing design

Special version on request.

Fixed bearing

Shaft ends

IEC 60034-7 defines the motor sides as follows:

DS (D side) = Motor driving side

NS (N side) = Non-driving side/side opposite to DS

Designations still used in Germany:

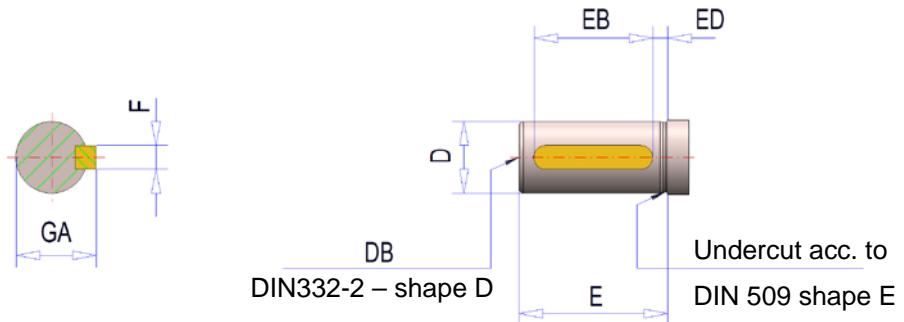

for DS = AS (A side)

for NS = BS (B side)

The shaft ends are cylindrical and their dimensions, tolerances and power assignments comply with DIN EN 50347.

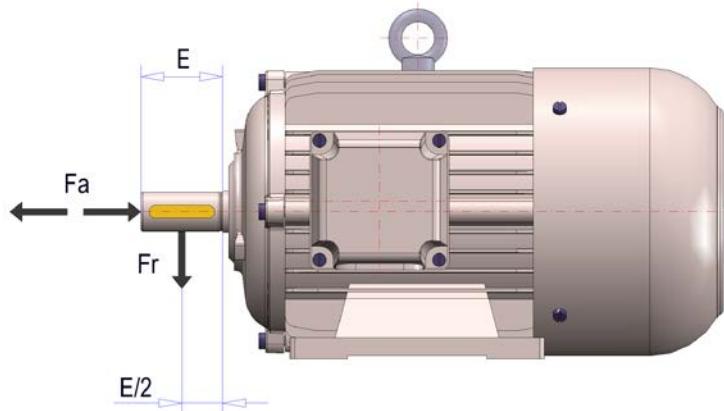

The tolerance of the shaft diameter is k6 (ISO) up to a diameter of 50 mm/m6 (ISO) for diameters exceeding 50 mm.

The DS shaft end of all standard motors has a centre bore acc. to DIN 322-2 shape D. The NS shaft end features a centre bore acc. to DIN 322-1. The motor comes with parallel keys complying with DIN 6885-1 shape A. Versions with a second free shaft end are available on customer's request.

Size	D	E	DB	EB	ED	GA	F

160	42	110	M16	90	10	45	12
180	48	110	M16	100	5	51.5	14

Radial and axial forces

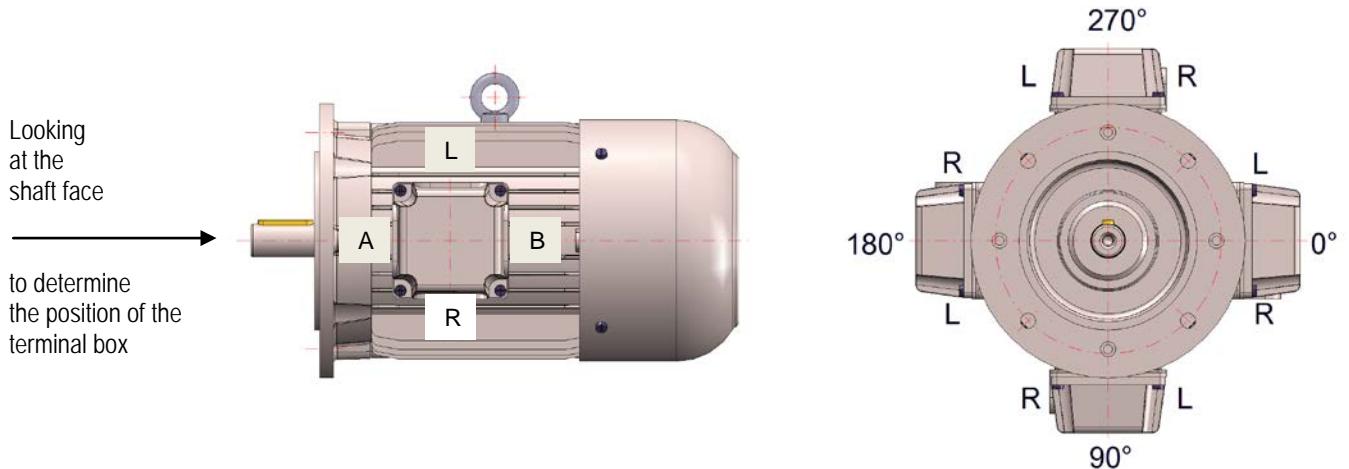

Size	Permissible radial force Fr [N]			
	Permissible axial force Fa [N]			
63	280	340	390	430
	240	320	380	440
71	330	410	470	510
	240	320	380	440
80	510	640	750	810
	400	500	600	670
90 S + L	620	770	890	970
	445	560	680	750
100 L	810	1010	1170	1300
	600	760	930	1020
112 M	1070	1330	1510	1710
	810	1090	1340	1490
132 S	1430	1740	2010	2200
	1190	1610	1900	2160
132 M	1470	1810	2080	2250
	1190	1610	1900	2160
160 M	1850	2190	2560	2780
	1450	1940	2300	2630
160 L	1920	2250	2650	2880
	1450	1940	2300	2630
180 M	2410	2870	3290	3670
	1800	2300	3000	3500
180 L	2510	2990	3430	3830
	1800	2300	3000	3500

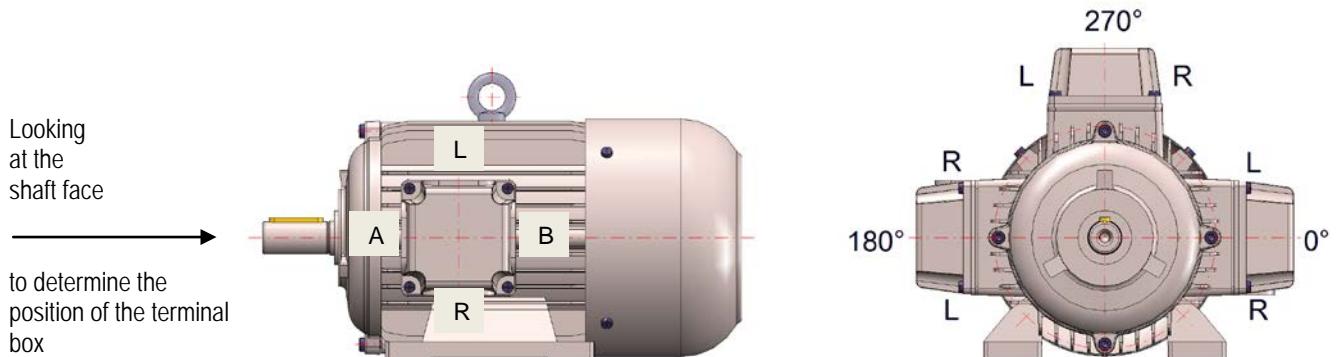

The above permissible loads are either radial or axial forces and apply to 50 Hz operation and a calculated bearing service life of 20,000 h. For 60 Hz operation, subtract approx. 10 %.

Terminal box position

The illustration below shows possible terminal box configurations and cable entry positions:

Standard terminal box configuration = 0°R

By default, the brake release lever (if present) and the terminal box of the external fan are in a line with the terminal box of the motor. Other versions have to be ordered separately.

Cable entries into the terminal box

The terminal boxes feature threads DIN EN 60423 for cable glands acc. to DIN EN 50262 but come without glands. Explosion-protected motors Zone 2 / Zone 22 come with ATEX cable glands and ATEX plug screws.

The customer is responsible for correct connection in compliance with generally applicable VDE standards. A terminal strip acc. to DIN 46294 is provided in the terminal box for this purpose.

The terminal boxes (covers) for size 63-160 are made of an aluminium alloy. Cast iron for size 180. Cast iron housings (special version on request) have terminal boxes also made of cast iron.

Size	Thread of contact screw	DIN 42925	HEW (IP 54/IP 55)	HEW (> IP 55)	Zone 2 / 22 Without brake	Zone 22 with brake

¹⁾ one-piece terminal box cover

²⁾ closed with screw plug

Other versions have to be ordered separately by the customer and agreed upon with HEW.

Single-phase motors with relay: see column > IP 55 / with operating capacitor only: see column IP 54 / IP 55.
Pole-changing motor > 6 Versions have to be agreed upon with HEW.

Special versions such as plugs or fitted cable set with and without terminal box are available.

Noise

All of the motors operate within the noise limits specified in DIN EN 60034-9. The A-rated average of the measuring surface sound pressure level L_{pA} at a distance of 1 m and the acoustic power level L_{WA} is specified.

The values only apply to single-revolution three-phase motors in thermal class "F" during mains operation with a nominal frequency of 50 Hz and a tolerance of +3dB(A).

Size	Sound pressure level L_{pA}							
	3000 rpm		1500 rpm		1000 rpm		750 rpm	
	L_{pA} dB (A)	L_{WA} dB (A)	L_{pA} dB (A)	L_{WA} dB (A)	L_{pA} dB (A)	L_{WA} dB (A)	L_{pA} dB (A)	L_{WA} dB (A)

180	72	83	62	73	60	71	60	71

Details for pole-changing three-phase current motors or deviating operating conditions on request.

Vibration

All armatures of the motors are dynamically balanced with half feather keys in accordance with DIN ISO 21940-32.

The vibration behaviour of the motors corresponds to the vibration severity level A in accordance with DIN EN 60034-14 (see following table).

Vibration severity level B can be supplied on request for quieter running.

The vibration speed v_{eff} [mm/s] is measured with standard motors with a speed of between 600 rpm and 3600 rpm.

Vibration limits for electric machines in accordance with DIN EN 60034-14.

Vibration severity level	Vibration severity limits dependent on size v_{eff} [mm/s]	
	Sizes 56 to 132	Sizes 160 to 280
A	1.6	2.2
B	0.7	1.1

Electrical design

Output, voltage and frequency

In the basic version, the motors are supplied for the following nominal voltages:

Voltage / circuit V	Frequency Hz	Output Factor $\square P_n$	Torque Factor $\square P_n$	Current Factor $\square P_n$
230 / 400 Δ / Y	50	1.0	1.00	1.0
254 / 440 Δ / Y	60	1.0	0.83	0.9
277 / 480 Δ / Y	60	1.2	1.00	1.0
400 / 690 Δ / Y	50	1.0	1.00	1.0
440 Δ	60	1.0	0.83	0.9
480 Δ	60	1.2	1.00	1.0

The permissible voltage-frequency fluctuations correspond to the conditions of DIN EN 60034-1.

Special voltages and frequencies and wide-range voltage versions by customer request.

For frequency inverter operation see page 1/15.

The nominal output applies to continuous operation in accordance with DIN EN 60034-1, in relation to a coolant temperature of 40° C and an installation elevation of <1000 m above sea level.

The following must be taken into consideration when selecting the best possible motor output:

- Required working machine output
- Operating mode
- Start-up, braking and reversing mode
- Torque curve of working machine
- Mains conditions
- Cooling, coolant temperature
- Installation elevation etc.

Heating and thermal classes

The choice of individual insulation system components determines the classification in the thermal classes in accordance with DIN EN 60034-1.

The limit temperature of the individual thermal classes consists of the coolant temperature of max. 40° C and the average temperature rise limit of the winding.

The following table shows the connection between the thermal classes and the limit temperatures:

Thermal class	Assigned limit temperature
B	120° C
F	145° C
H	165° C

HEW supplies the motors in thermal class F as standard.

The windings are always manufactured with phase insulation as well as high-quality enamelled wire and impregnating resin. The high degree of electrical strength that this achieves is the guarantee of problem-free use of the motors on the frequency inverter.

Capacity

According to DIN EN 60034-1, the motors can be overloaded with 1.5 times the nominal current for a period of 2 minutes or 1.6 times the nominal torque over a period of 15 seconds.

Rotation direction

Basically, the motors are suited for both directions of rotation. The winding leads U1, V1, W1 of the motors are designed such that the motor turns in clockwise direction if they are connected to the 3-phase mains to L1, L2, L3 respectively.

The motor turns counter clockwise if two outer leads are swapped (e.g. L1 with L2).

The rotation direction is indicated when looking at the shaft face (DS).

Earthing and PE connection

The motors feature a PE connection near the terminal strip. Explosion-protected motors always feature an additional external earthing terminal at the housing.

Operation on 60 Hz mains

Motors designed for 50 Hz can also be operated on 60 Hz mains. For the effect on the rated data, please refer to the table below.

Frequency Hz	Voltage factor - U_n	Power factor - P_n	Speed factor - n_n	Torque factor - M_n	Start-up torque factor - M_{An}	Breakdown torque factor - M_{Kn}
50	1.00	1.00	1.00	1.00	1.00	1.00
60	1.00	1.00	1.20	0.83	0.69	0.69
60	1.20	1.20	1.20	1.00	1.00	1.00

Operation on the frequency converter

When operated on a frequency inverter, the speed of three-phase asynchronous motors can be set or adjusted continuously via the frequency.

Careful planning is the prerequisite for optimum matching of inverter and motor.

The motor selection primarily depends on the desired speed range and the torque curve of the working machine. Then follows the selection of the winding and the cut-off frequency (break frequency).

An evaluation of the minimum and maximum speed determines whether or not the motor requires an external fan. This depends on the following factors:

- Size
- Number of poles
- Operating mode
- Ambient conditions
- Available thermal reserves

U/f = constant up to 50 Hz:
 Field weakening operation 50 Hz and above
 Winding designed for 230 / 400 V or 400 / 690 V
 Maximum inverter voltage 230 V or 400 V

			Mains		Inverter	
f Hz	U V	Circuit	P _N	M/M _n	P _N	M/M _n
5	40 ¹⁾	Δ / Y ²⁾			0.10	1.00
50	400	Δ / Y ²⁾	1.00	1.00	1.00	1.00
87	400	Δ / Y ²⁾			1.00	0.57

- 1) - Boost setting ignored
 2) - Depends on the winding design

When operated with an inverter and U/f = constant, the flux and the torque in the motor remain constant. Inverter, winding design and specification of the cut-off frequency determine the range where such operation is possible.

In field weakening operation, the voltage remains constant, only the frequency is increased. The torque drops proportional with 1/f (operation with constant power).

The tables show different power and torque curves over a frequency range up to 87 Hz.

Boost setting:

To keep the flux constant, the inverter output voltage has to be increased in the lower frequency range with the statical boost. This prevents excessive slippage, which would cause the motor to heat up and fail. The amount of the rise depends on the size, the number of poles and the motor design and has to be optimised in dependence on the drive.

U/f = constant up to 87 Hz:
 Winding design 230 / 400 V
 Maximum inverter output voltage 400 V

			Mains		Inverter	
f Hz	U V	Circuit	P _N	M/M _n	P _N	M/M _n
5	23 ¹⁾	Δ			0.10	1.00
50	230	Δ	1.00	1.00	1.00	1.00
87	400	Δ			1.73	1.00

- 1) - Boost setting ignored
 2) - Depends on the winding design

Special versions on demand

Motor protection

A motor protection switch monitoring the current must be set to the nominal current indicated on the rating plate.

Only a motor protection directly measuring the temperature is effective in case of frequent switching, short-term operation, coolant failure or great temperature amplitudes. To this end, there are the following options:

- **Temperature switch as NC (PTO)**

When the temperature matching the thermal class is exceeded, the temperature switch automatically opens the auxiliary circuit and switches on only when the temperature has dropped significantly.

Switching capacity: For AC: 250 V 1.6 A.

- **PTC protection:**

The integrated PTCs are operated in conjunction with a triggering device. If the nominal temperature specific for the thermal class of the motor is exceeded, the temperature sensors abruptly change their resistance, which is evaluated by the triggering device in the control circuit. The relay installed in the device has a changeover contact whose NO and NC contacts can be used for control purposes.

Advantage: Safety device monitors itself; low switching tolerance; fast switching on of the drive.

- **Measuring the winding or bearing temperature**

With PT 100 platinum temperature sensors or KTY sensors, the temperatures of the motor winding or bearing can be measured directly.

By default, the temperature monitoring connections are led out to a terminal strip in the main terminal box. If desired, a separate terminal box for the auxiliary equipment can be fitted.

Installation altitude and coolant temperature

For coolant temperatures other than 40° C

or installation altitudes above 1000 m above sea level,
power reductions are required.

In this case, the nominal power has to be corrected
with the factors given in the table below:

Installation altitude above sea level	Ambient temperature in °C			
	40	45	50	60
1000 m	1.00	0.96	0.92	0.82
1500 m	0.97	0.95	0.89	0.79
2000 m	0.94	0.9	0.86	0.77
2500 m	0.90	0.86	0.83	0.74
3000 m	0.86	0.82	0.79	0.70
3500 m	0.82	0.79	0.75	0.67
4000 m	0.77	0.74	0.71	0.63

Three-phase motors

Cooling (ventilation)

Internal ventilation (IC 411):

All standard motors are equipped with a robust and temperature-resistant plastic fan. On customer's request, a glass fibre-reinforced or metal version is also possible.

External ventilation (IC 416):

External fans are also used to increase the nominal power, in case of high switching frequencies and, if necessary, for inverter operation.

External fans are available as single-phase or three-phase variants.

Unventilated (IC 410):

used for special motors with adapted power or restricted duty cycle (on request).

Liquid cooling (IC 3S7):

used for hygiene motors (see part 14).

Standstill heating

A standstill heating can be implemented in motors whose windings are subject to condensation, e.g. motors at standstill in humid environments or motors subject to high temperature fluctuations.

This solution warms up the air inside the motor via the outside temperature, which prevents condensation inside the motor. The standstill heating must not be switched on while the motor is in operation.

Motor size	Heating power W	Supply voltage V
63	50	230 ± 10%
71	50	230 ± 10%
80	50	230 ± 10%
90	50	230 ± 10%
100	52	230 ± 10%
112	52	230 ± 10%
132	52	230 ± 10%
160	80	230 ± 10%
180	80	230 ± 10%

Reluctance motors

7

Reluctance motors

The reluctance motor combines the characteristics of asynchronous and synchronous motors. The special feature is a rotor with distinguished poles and damper cage. This makes the reluctance motor start in the asynchronous and then switch to the synchronous mode. It runs at the synchronous speed until the reactive torque (synchronous breakdown torque or pull-out torque) is exceeded.

With these properties, the reluctance motor suits many applications where more complex servo technology or asynchronous motors with encoder systems had to be used until now. This applies primarily to plants requiring several drives to run at synchronous speeds or constant speeds at varying loads. Another benefit is the robust and maintenance-free design.

Mechanical design

The reluctance motor uses the standard stator of the asynchronous motor. For this reason, it is generally possible to implement all mechanical variants as described in the planning section for asynchronous motors. If desired, the motors can also be equipped with a mechanical spring-loaded brake. We recommend a brake in noise-reduced version (see Brake motors / Part 10).

Electrical design

By default, HEW manufactures the insulation system in thermal class F using high-quality enamelled wire and windings with phase insulation. This warrants a high electrical strength against loads caused by switching and commutating voltages and frequency inverter operation. The motors can be equipped with a PTC or thermostatic switch as motor protection. The reluctance motors are available with 2, 4 and 6 poles. Special windings for custom drive solutions are available on request.

Reluctance motor with frequency inverter

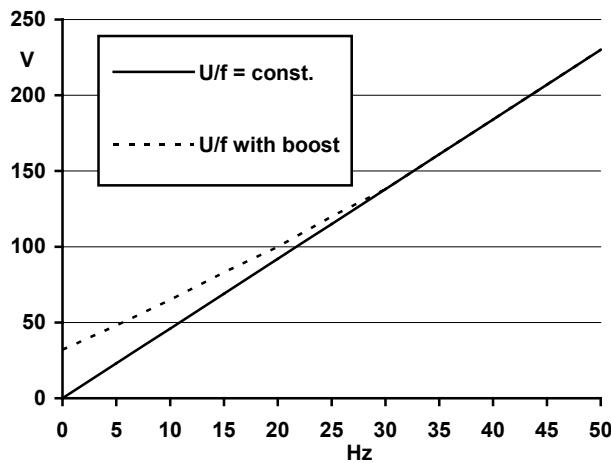

The motor is selected according to the required load torque and the minimum/maximum frequency.

The acceleration torque has to be heeded for highly dynamic drives.

Depending on the frequency/speed limits, an internal or external fan variant has to be chosen.

Internally ventilated reluctance motors en are dimensioned such that they are capable of outputting the nominal torques specified in the Technical Data from approx. 20 Hz to the cut-off frequency permanently. To operate the motor at the nominal torque and below 20 Hz, only a reduced duty cycle is allowed, or an external fan is needed.

The voltage has to be raised via static boost because in the lower frequency range at $U/f = \text{constant}$, the flux and thus the torque do not remain constant. The amount of the rise depends on the size, the number of poles and the motor design and has to be optimised in dependence on the drive.

The illustration shows the U/f curves with and without boost in principle. The frequency inverter make determines the possible boost settings. The maximum torque of the reluctance motor is proportional to the square of the voltage. As the ratio of pull-out torque to nominal torque is approximately 1.6, operation in the field weakening range ($U = \text{constant}$) is not feasible or possible with restrictions only.

Fits and tolerances

Excerpt of major fits and tolerances

Designation of dimension	Designation of as per DIN EN 50347	Fits or tolerances
N	Diameter of flange centring	\varnothing 50 - 250 j6 \varnothing 250 - 300 h6
D	Diameter of DS shaft end	\varnothing 9-48 k6
DA	Diameter of NS shaft end	\varnothing 9-48 k6
M	Bolt circle diameter of fastening bores	\varnothing 90 - 120 +/- 0.3 \varnothing 140 - 350 +/- 0.5
H	Distance between shaft centre line and underside of feet (basic dimension)	- 0.5
E	Length of shaft end starting at the shoulder on the drive side	- 0.5
EA	Length of shaft end starting at the shoulder on the drive side	- 0.5
S	Diameter of fastening bores in the flange, or nominal thread diameter	+/- 0.2
GA	Distance between upper side of parallel key and opposite surface of DS shaft end	\varnothing 9 - 11 - 0.1 / -0.13 \varnothing 14 - 48 - 0.2 / -0.25
GC	Distance between upper side of parallel key and opposite surface of NS shaft end	\varnothing 9 - 11 - 0.1 / -0.13 \varnothing 14 - 48 - 0.2 / -0.25
F	Width of parallel key groove or parallel key of DS shaft end	N9 or h9
FA	Width of parallel key groove or parallel key of NS shaft end	N9 or h9

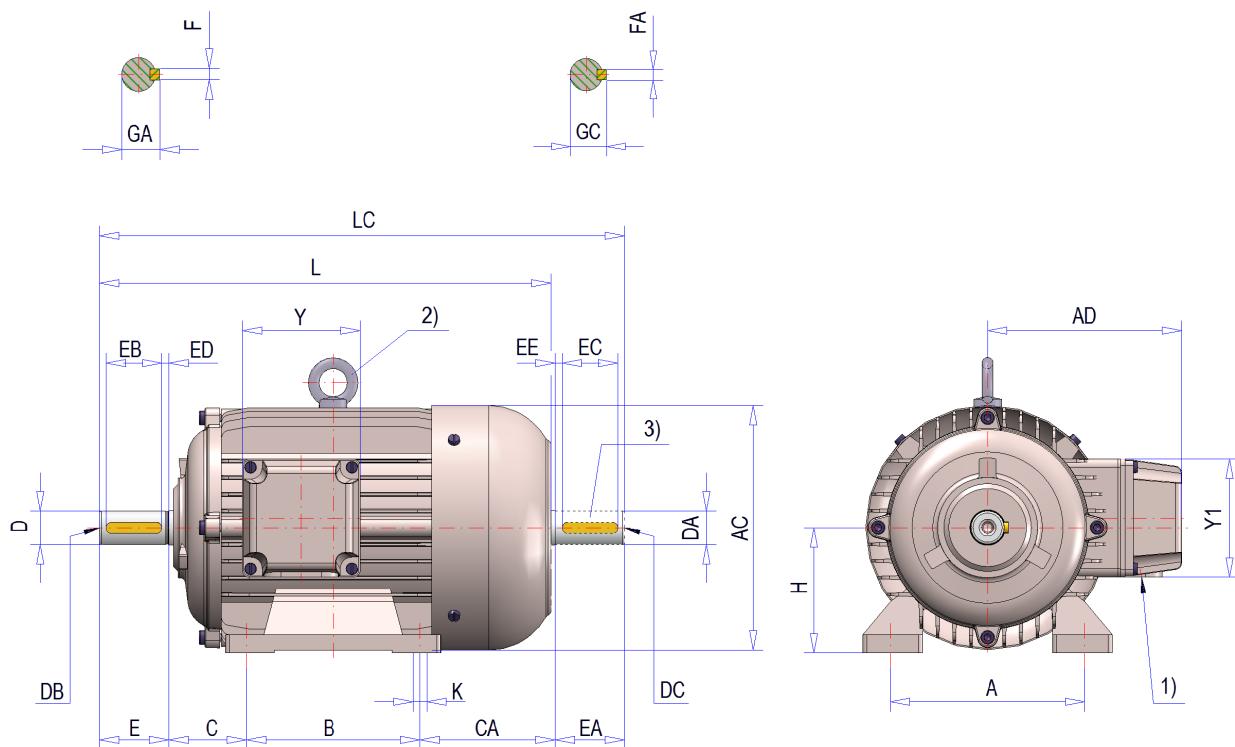

Three-phase motors

Three-phase motors - surface cooling, cooling type IC411 (internal ventilation)

Types R 63 K – 180 L

Protection class IP54 - IP55

Design B3 *

1) See planning section page 1/12

2) With lifting eye from size 112 onward

3) 2nd shaft end optional (standard shown – different dimensions possible)

Fits and tolerances see page 8/2

Three-phase motors

Three-phase motors - surface cooling, cooling type IC411 (internal ventilation)

Types R 63 K – 180 L

Protection class ≥ IP56

Design B3 *

1) See planning section page 1/12

2) With lifting eye from size 112 onward

3) 2nd shaft end optional (standard shown – different dimensions possible)

Fits and tolerances see page 8/2

Subject to technical amendments

Three-phase motors

Three-phase motors - surface cooling, cooling type IC411 (internal ventilation)

Types R+F 63 K – 180 L

Protection class ≥ IP56

Design B35 *

1) See planning section page 1/12

2) With lifting eye from size 112 onward

3) 2nd shaft end optional (standard shown – different dimensions possible)

4) Dimensions LA see page 8/6

Fits and tolerances see page 8/2

Subject to technical amendments

Single-phase motors

9

Single-phase motors

SINGLE-PHASE MOTORS

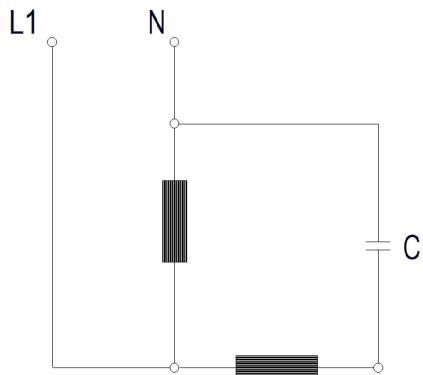

For dimensional sheets see page 9/5.

Single-phase motors

Single-phase motors can be operated on single-phase 230 V mains. Depending on the required start-up torque, you can choose one of the following versions

Single-phase motors with operating capacitors, type REBK

These motors - given the same size and number of poles - feature the same power as 3-phase motors but a relatively low start-up torque (see Technical Data, page 9/3). For this reason, they are particularly suited for drives for which a low start-up torque is required or which start up without load. The capacitor remains permanently switched on. The motors cannot be used for prolonged idling because this could exceed the permissible limit temperatures.

Voltage and frequency

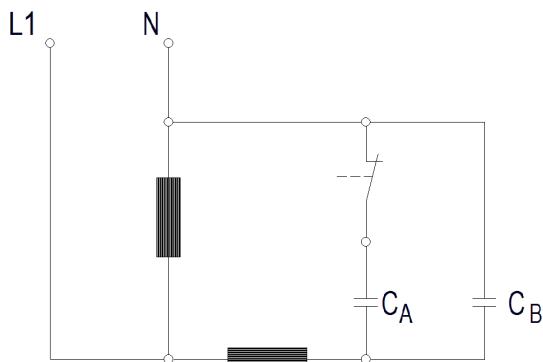

The motors are designed for 230 V, 50 Hz. Other voltages and frequencies on request.

Direction of rotation

When looking at the drive side shaft end, the motors turn in clockwise direction, i.e. to the right. The direction of rotation can be changed by swapping the jumpers on the terminal strip according to the wiring diagrams.

Single-phase motors with start-up and operating capacitors, type REBK ... AR

This version combines the high power of the REBK type and a high start-up torque (see Technical Data, page 9/4). Once the motor has reached the nominal speed, the start-up capacitor is switched off with a start-up relay or centrifugal switch.

Capacitors

The motors come with start-up and operating capacitors fitted by default. The capacitors are also available separately. Operation capacitors are low-loss metallised paper (MP) power capacitors with self-healing effect acc. to VDE 0560 Part 1 and 8.

The start-up capacitors are electrolytic capacitors and comply with VDE 0560 Part 1 and 8. Other motor data may result in changed capacitor sizes.

Special versions on demand

Brake motors

10

Three-phase motors

THREE-PHASE BRAKE MOTORS

For dimensional sheets see page 10/11.

Three-phase motors

Brake motors

Brake motors are single-phase or 3-phase asynchronous motors with squirrel cage rotor equipped with a mechanical brake. Braking does not subject the motor winding to a thermal load.

Brake motors are used where moving masses have to be decelerated in a short period of time or where masses have to be held in a defined state. For example in lifting and travelling drives, machine tools, packaging machines, transport and conveyor technology, servo drives and many more.

Brake motors are characterised by:

- shortening of ancillary times by reduced motor coast-down times
- locking brake in case of power failure
- exact approaching of a certain position
- increased motor switching frequency
- matching of braking torque to work conditions
- high operational safety due to robust design
- long service life

The brake motors are available with the following brake types:

- Electromagnetically released spring-loaded brake type B
- Electromagnetically operated brake type EB

The brakes comply with VDE 0580. They are exclusively intended for dry operation.

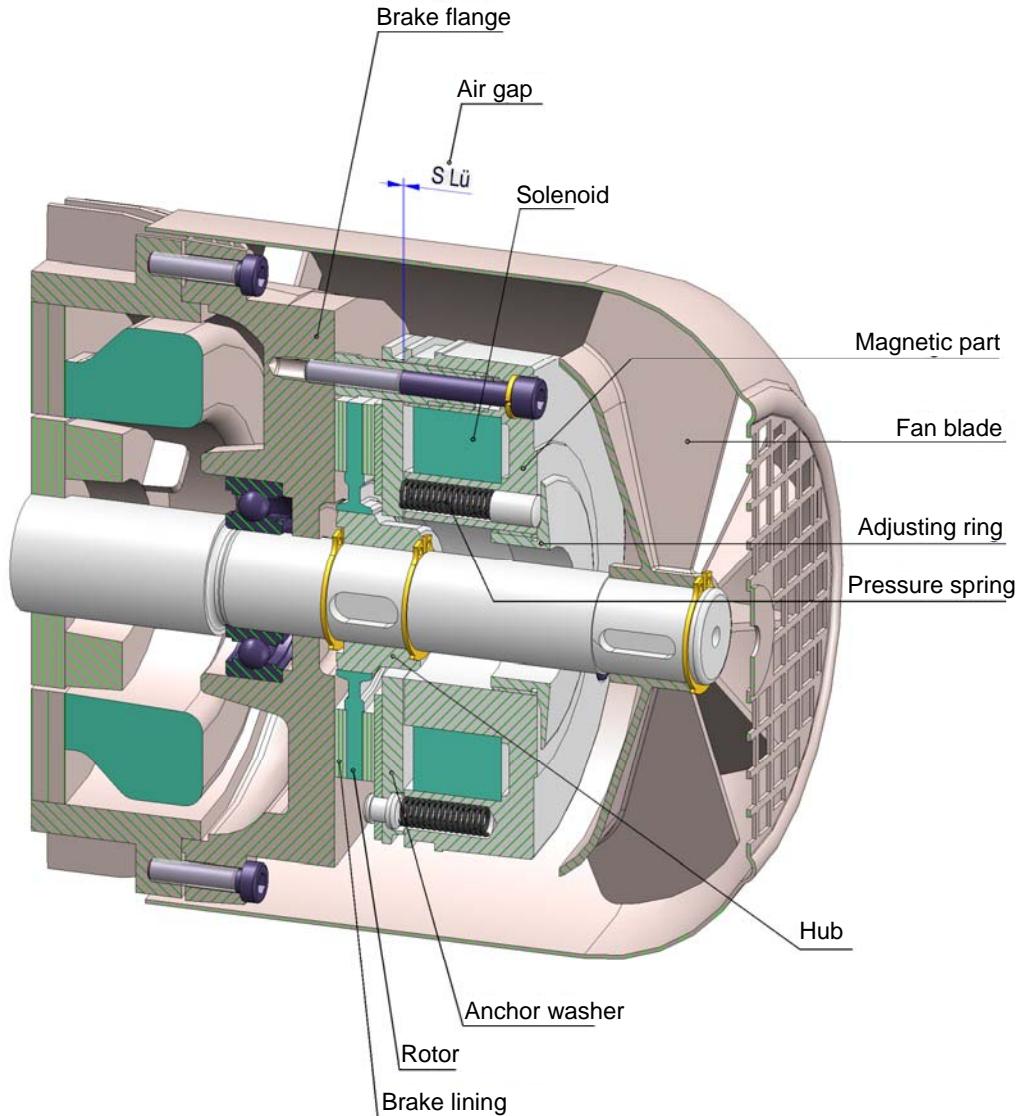

Electromagnetically released spring-loaded brake type B

This brake is a single-disc brake with two friction surfaces. In the deenergised state, several pressure springs generate the braking torque by friction locking. The brake is released electromagnetically.

Generating the braking torque

During braking, the pressure springs push the rotor axially sliding on the hub or shaft via the armature disc against the counter friction surface. When the brake is applied, there is an air gap S_{Re} between armature disc and magnet part.

To release the brake, a direct current excites the solenoid of the magnet part. The resulting magnetic force pulls the armature disc against the spring force to the magnet part. The rotor is no longer subjected to the spring force and can turn freely. The customer can adjust the spring force of the standard brake type B with the adjusting ring.

Voltage and circuit type

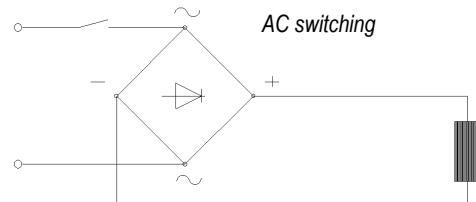

The brakes also available for voltages other than the standard voltages 24 V, 103 V, 180 V, and 205 V [DC]. According to DIN VDE 0580, the permissible voltage change is +/- 10 % of the nominal voltage.

A rectifier is used to connect the brakes to an AC supply. These rectifiers, specially developed for supplying DM solenoids, are protected with a varistor circuit against voltage peaks that occur in connection with switching, contact chatter, excessively long cables or poor mains conditions. The brake motors can be equipped with one-way or bridge rectifiers located in the terminal box.

The brake motors come in two basic circuit variants:

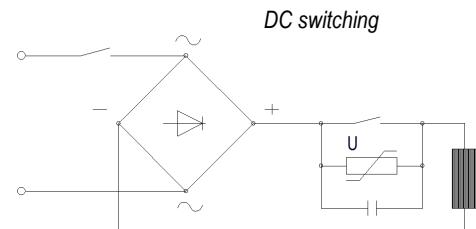

AC switching

By default, the AC side of the rectifier is connected to the motor terminals, and the DC side to the brake solenoid. This results in a smooth, delayed brake engagement.

DC switching

The AC side of the rectifier is connected to the motor terminals. During switch-off, the DC circuit between rectifier and brake solenoid is interrupted with an auxiliary contact of the motor protection switch. The magnetic field of the brake breaks down very quickly, which makes the brake torque available faster.

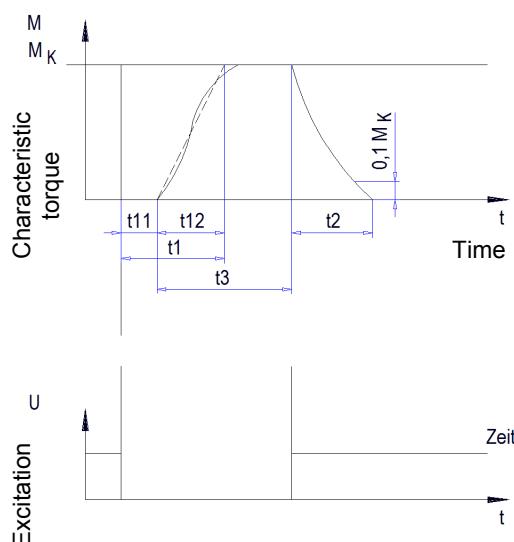

Switching times

The transition from a state free of braking torque to a state of steady braking torque is not free of delay. The switching times of the brake depend on the circuit variants mentioned. The engagement time controls the application of the brake, the release time the releasing of the brake. DC switching results in a significantly shorter engagement time t_1 . The release time t_2 can be reduced with devices that use quick or over-excitation.

The switching times given in the table on page 10/5 apply to DC switching at nominal release travel S_{Re} and warm brake solenoid. The engagement times are approx. 10 times longer in case of AC switching.

Several factors such as temperature, release travel between armature and solenoid carrier (depending on the state of brake wear), a potentially reduced brake torque, the rectifier type, etc. affect the switching times.

t_{11} = Response delay during engagement
 t_{12} = Rise time of braking torque
 t_1 = Engagement time
 t_2 = Release time
 t_3 = Slippage time

Technical data (for standard brake type B)

Type	Braking torque	Nominal input power	max. speed *	Release travel	Permissible release travel	Switching times DC switch-off	Moment of inertia	Weight magnetic part	
	Mk [Nm]	[P _{20°C}] [W]	n max. rpm	S _{Re} [mm]	S _{Re max.} [mm]	t ₁ [ms]	t ₂ [ms]	J [kgm ² · 10 ⁻⁴] [kg]	
B4	4	20	6000	0.2	0.5	28	45	0.15	0.8

Brake motor power data

Brake size and motor size usually correspond in such a manner that the switching frequency to be obtained with the brake motor is not restricted by the brake but by the motor temperature. The permissible switching frequency calculated from the moment of inertia, counter torque and load factors can in most cases be assumed to also be the permissible brake switching frequency for the spring-loaded brake. This value must be higher than the required number of start-ups or brake procedures per hour.

Brake type B	B4	B8	B16	B32	B60	B80	B150	B260	B400
Braking torque [Nm]	4	8	16	32	60	80	150	260	400

Size 63	x								
Size 71	x	o	o						
Size 80	o	x	o						
Size 90	o	o	x	o					
Size 100		o	o	x	o				
Size 112			o	o	x	o			
Size 132				o	o	x	o		
Size 160					o	o	x	o	
Size 180							o	x	o

x = standard assignment

o = possible assignment

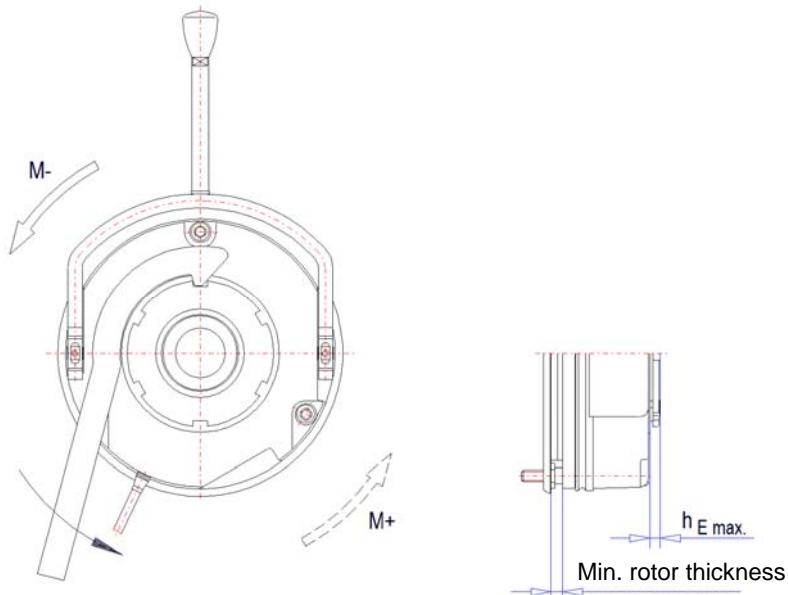

Brake torque reduction

On the standard brake type B, the brake torque M_k can be reduced with the adjusting ring in the magnet section (using a hook wrench acc. to DIN 1810, shape A). Each notch of the adjusting ring changes the brake torque as specified in the table. The adjusting ring may be screwed out only to the maximum dimension $h_{E\max}$ (see table). Please note that engagement and release times change. The torque reduction is independent of the used nominal torque.

Brake torque M_k	4 [Nm]	8 [Nm]	16 [Nm]	32 [Nm]	60 [Nm]	80 [Nm]	150 [Nm]	260 [Nm]	400 [Nm]
Torque reduction per notch [Nm]	0.2	0.35	0.8	1.3	1.7	1.6	3.6	5.6	6.2
Adjusting ring projection $h_{E\max}$ [mm]	4.5	4.5	7.5	9.5	11	10	15	17	19.5
Min. rotor thickness [mm]	4.5	5.5	7.5	8.0	7.5	8.0	10	12	15.5

Table only applies to brake Type B with adjusting ring

Subject to technical amendments

Protection class

The magnet section of the brake has protection class IP 66. If the spring-loaded brake is installed in the fan cowl, the protection class is at least IP 55, depending on the design measures taken.

Higher protection levels by using other brake types are possible on request.

The ambient temperature is -20° C to +40° C. If high humidity and low temperatures prevail, measures to protect the rotor disc and the rotor against freezing up have to be taken.

Maintenance

The brakes are next to maintenance-free. We recommend checking the release travel S_{Re} at fixed intervals. The wear depends on the work of friction that has to be performed each time the brake is applied. If the maximum release travel S_{Remax} (see page 10/5) has been reached, the brake has to be set to S_{Re} again. The brake can be adjusted at least 5 times, but only as many times as the minimum rotor thickness (see table above) has not been reached.

Controlling drives for frequent switching

The drive shall be controlled such that the motor does not start if the brake is applied.

The response times of motor and brake of large brake motors in particular differ greatly. Starting with the brake applied frequently will result in premature wear of the brake lining and, due to the continuously repeated hight start-up current, will cause the winding to heat up and the motor to fail.

With the following options, the response times of motor and brake can be matched:

- A micro switch installed inside the brake can control the motor control voltage. The motor switches on as soon as the brake releases.
- The response times of motor and brake can be compensated for with a timer relay.
(timer relay adjusting range 0.05 ... 1s).
- Fast switching with a fast acting rectifier can be performed; this will trigger the brake coil with a higher voltage while the motor starts. The voltage drops to the nominal value as soon as the brake has been released.

Special designs

- Brake motors with fast excitation for high switching frequencies
- Brakes with manual release (TÜV-approved)

As an option, the brake is also available with manual release. When the manual release is actuated while the brake is deenergised, the brake releases mechanically, and the shaft can be moved easily. The manual release lever is located close to the fan cowl.

A lockable manual release lever is available on request.

- Brakes for frequency operation and single-phase motors

The design reduces vibrations, noise and points of resonance that can occur in this mode.
- Protection class IP 65 brakes
- ATEX brakes

Brakes suited for operation in explosive areas of Zone II
- Corrosion-protected brakes
- Brakes with micro-switch

Micro switches to monitor the release travel and the wear or to monitor the manual release function
- Brakes suited for encoder mounting
- Brake motors with additional flywheel mass. The additional flywheel mass installed in the fan cowl enables jerk-free starting and stopping of the motor.
- Brake motors with external cooling. Brake motors can be equipped with external ventilation to obtain high switching frequencies.
- Brake motors with second shaft end (shaft end on request)
- Double brakes for stage machinery/theatre version (see Part 11)

Subject to technical amendments

Three-phase motors

Three-phase brake motors – surface cooling, cooling type IC411 (internal ventilation)

Types R 63 K – 180 L

Protection class IP54-IP55 **

Design B3 *

1) See planning section page 1/12

2) With lifting eye from size 112 onward

3) 2nmd shaft end (dimension on request)

4) Manual release as option (can be ordered in positions 0°/90°/180°/270° see page 1/11)

Fits and tolerances see page 8/2
Subject to technical amendments

Brake motors with double brake for stage machinery

11

Three-phase motors

THREE-PHASE BRAKE MOTORS WITH DOUBLE BRAKE (FOR STAGE MACHINERY)

For dimensional sheets see page 11/3.

Three-phase motors

Brake motors for stage machinery

The HEW series of stage machinery motors was specially developed for stage machinery use in theatres and opera houses. Our motors move curtains, podiums, rotating, lifting or sliding stages as well as stage sets, unnoticed of the audience and without exposing actors and stage staff.

To meet the specific requirements of stage machinery, HEW brake motors in the range of 0.37 – 30.0 kW in 4-pole design (also in 6-pole design as option) which can be used in the above-stage or below-stage machinery of theatres. The motors comply with the high demands of DIN 56950 and BGV C1. This ensures the highest possible working safety for people standing in the vicinity of the drive units. All motors are equipped with double brakes, as work goes on continuously under suspended loads such as parts of the stage set or lighting equipment. The standard design features brakes with manual release. When the manual release is actuated while the brake is deenergised, the brake releases mechanically, and the shaft can be moved easily.

The noise levels of the drives is also exceptionally low. The windings are always manufactured with phase insulation, which makes the drives suitable for operation with frequency inverters. In this way, the drive solutions can also be controlled very flexibly, either individually or in groups.

As option, the drives can be equipped with thermistors (PTC) or thermostatic switches (bi-metal).

As encoder or feedback system, incremental encoders (TTL / HTL / sin-cos), absolute encoders (single-turn or multi-turn, combined encoders), sensor bearings or inductive sensors can be mounted.

The standard motor housing is made of aluminium, from size 80 onward, the motors can also be ordered with cast iron housings.

The following objects were equipped with HEW stage machinery motors:

Semperoper Dresden	Germany
Stadttheater Paderborn	Germany
Anhaltinisches Theater Dessau	Germany
Stadttheater Saarbrücken	Germany
Kulturhaus Kornwestheim	Germany
Royal Opera House Muscat	Oman
Opera and Ballet Theatre Novosibirsk	Russia
het Nationale Toneel Den Haag	Niederlande

Three-phase motors

Poles: 4

Nominal data at 400V, 50 Hz

Thermal class F

Operating mode: S3-40%

Synchronous speed: 1500 rpm

Surface cooling, unventilated

Rotating field motors

ROTATING FIELD MOTORS

For dimensional sheets see page 12/4.

Rotating field motors

Rotating field motors are three-phase asynchronous motors with special squirrel cage rotor characteristics. Their electrical design is such that they develop their highest torque (standstill torque) when the nominal voltage is applied at standstill.

Two variants are available:

- IC 410 (unventilated variant)
- IC 416 (externally ventilated variant)

The motors are suitable for continuous operation at standstill torque (S1 operation) or three times the standstill torque in intermittent operation (S3 - 25%).

The chart shows the speed/torque curve of rotating field motors.

The obtained speed depends on the counter torque.

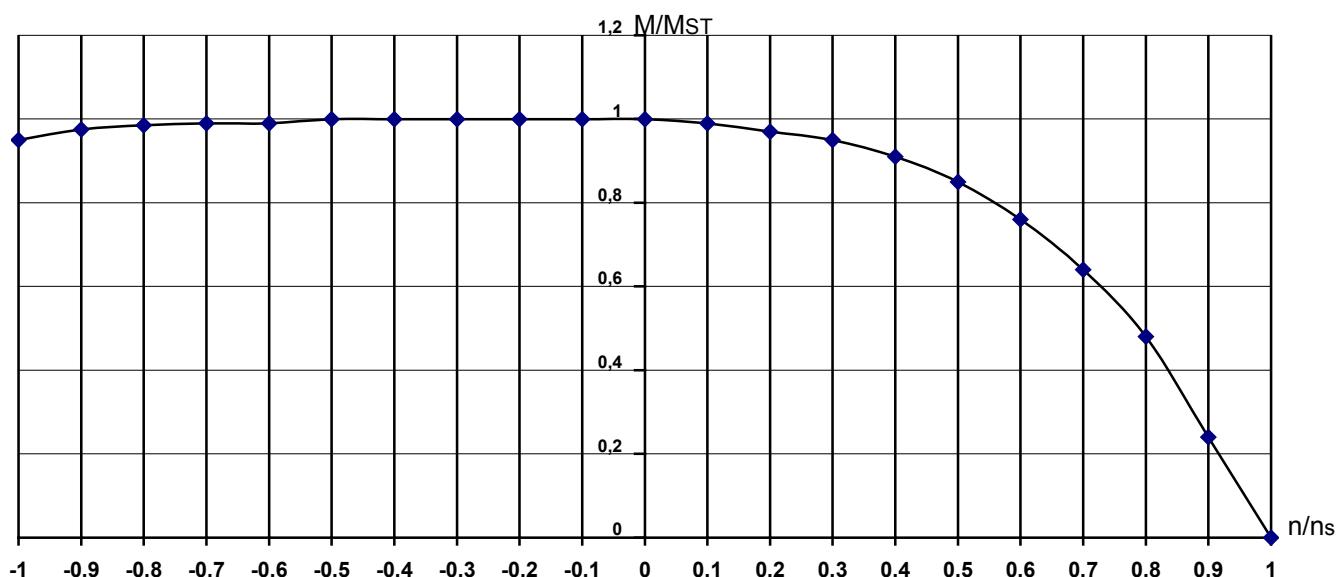

Continuous operation between 0 n/ns and 1 n/ns in the intended operating mode is permitted.

If operation between -1 n/ns and 1 n/ns is required, ensure that the limit temperature of the thermal class is not exceeded. In this case, we recommend using full thermal motor protection (see Section 1/18 Motor protection).

Chart:

MST = Standstill torque

ns = Synchronous speed

Circuit

For S1 operation, the motors are wired in a star configuration. By switching to a delta configuration, the standstill torque changes to three times the value. In this case, only intermittent operation S3 - 25% is permitted (see Technical Data, page 12/3).

It is impossible to obtain the standstill torques for intermittent operation S3 - 40% mentioned on page 12/3 by simple switching over; instead, a modified winding is necessary.

Torque change

The specified standstill torques are the maximum torques, related to the nominal voltage.

The torque can be reduced by reducing the voltage ($M \propto U^2$).

Using a three-phase AC controller, the standstill torque of the motors can thus be regulated continuously between maximum and zero.

Special version

As special version, rotating field motors are also available for single-phase operation.

Other size/torque assignments are available on request.

Rotating field motors

Submersible motors

13

Submersible three-phase motors

SUBMERSIBLE MOTORS

For dimensional sheets see page 13/5.

Submersible motors

HEW submersible motors are specially designed for operation under water. Submersible three-phase motors are used to pump drain water, waste water, river and rain water as well as all kinds of muddy waters and for mixer and homogeniser agitators. The housing is an optimised cast iron motor barrel casing with less corners and edges. Due to its robust design, the drive has a very long service life. A pre-assembled power cable is encapsulated at the motor and allows for easy installation on site. The submersible motors come in protection class IP 68 and are mainly used under water at a maximum immersion depth of 10 m. The motors are designed for direct fastening to the drive (e.g. gear, agitator or pump).

The windings are always manufactured with phase insulation, which makes the drives suitable for operation with frequency inverters. These drives are available in the power range of 1.1 kW to 5.5 kW. Motors up to a power of 30.0 kW are available on request.

Standard motors are made as 4-pole variants. Other pole numbers or pole-changing motors are also available on request.

As special design, the motors are also available with closed brake system or standstill heater. Further special versions are available on request.

Standards and regulations

The motors meet the commonly applicable standards and rules (see Part 1, page 1 / 4)

Housing version

Flanges and housing parts are made of cast iron, all connection elements such as screws and fastening elements are made of corrosion-proof and acid-proof materials.

Shaft end

The standard shaft ends are cylindrical and their dimensions, tolerances and power assignments comply with DIN EN 50347. The tolerance of the shaft diameter is k6 (ISO) up to a diameter of 50 mm/m6 (ISO) for diameters exceeding 50 mm. The DS shaft end of all submersible motors has a centre bore acc. to DIN 322-2 shape D. The motor comes with parallel keys complying with DIN 6885-1 shape A.

Standard motors come with a shaft end made of 1.4021 (corrosion-proof and acid-proof). Other materials can be used on customer's request. Motors with special shafts (e.g. for direct mounting to the gear) are also available as an option.

Vibration

All armatures of the motors are dynamically balanced with half feather keys in accordance with DIN ISO 21940-32. The vibration behaviour of the motors corresponds to the vibration severity level A in accordance with DIN EN 60034-14 (see the table in Part 1, page 1/13). Vibration severity level B can be supplied on request for quieter running.

Storage

The motors are equipped with generously dimensioned roller bearings. The DS bearing is a fixed bearing. The NS bearing is a floating bearing held in place with springs.

Shaft seal

The motor inside is sealed with a radial seal ring at the shaft. This seal complies with the "oil tight" protection class IP 67.

Leakage monitor

To monitor the seal, a leakage monitoring unit can be fitted on customer's request. The measuring line leading to the electrodes is integrated in the motor power cable. Evaluation by way of resistance measuring occurs with appropriate electronic components. The evaluation device is not included in the scope of delivery.

Electrical design

The power values given in the list refer to fully immersed units with a maximum coolant temperature of 40 °C at operating mode S1 (continuous operation).

Rated voltage and frequency

The submersible motors are available for the following rated voltages:

3AC, 50 Hz – 400 V, 500 V, 690 V

3AC, 60 Hz – 400 V, 440 V, 460 V

Voltage tolerance $\pm 10\%$, acc. to EN 60 034 Part 1 – Section B

Other rated voltages are available on customer's request.

Thermal class

The standard design of motors is thermal class F. As an option, motors can also be thermal class H. An improved moisture protection is also available as an option.

Motor connection

The motors are connected with watertight, moisture-proof rubber cables. The standard power cable length is fifteen metres.

Motor protection

A motor protection switch monitoring the current must be set to the nominal current indicated on the rating plate. Only a motor protection directly measuring the temperature is effective in case of frequent switching, short-term operation, coolant failure (dry running) or great temperature amplitudes. To this end, there are the following options:

- Temperature switch as NC (PTO)

When the temperature matching the thermal class is exceeded, the temperature switch opens the contact and closes it only when the temperature has dropped significantly.

Switching capacity: For AC: 250 V 1.6 A.

By default, the temperature monitoring connections are integrated in the power cable.

As an option, the motors can also be equipped with PTCs; in this case, a shielded motor cable is mandatory.

Standstill heating

A standstill heating can be implemented in motors whose windings are subject to condensation, e.g. caused by high temperature fluctuations.

This solution warms up the air inside the motor via the outside temperature, which prevents condensation inside the motor. The standstill heating must not be switched on while the motor is in operation.

Submersible three-phase motors

Number of poles: 4

Nominal data at 400V, 50 Hz

Thermal class F

Operating mode: S1

Synchronous speed: 1500 rpm

Surface cooling IC 410

Max. coolant temperature 40°C

Fully immersed

Hygiene motors

14

For dimensional sheets see page 14/4.

Hygiene motor

Especially in the sensitive production areas of foodstuffs technologies, i.e. in the production and processing of foods and beverages, the highest demands are placed on hygienic conditions. This also applies to production in the chemical and pharmaceutical industries. Here, even sterile production environments are often required.

The construction of conventional motors often caused problems for the designers of such production facilities, as these motors are usually equipped with cooling fins and fans, in which dirt can accumulate. Cleaning is hindered because of poor accessibility.

As a result, there is a risk of germ formation. As well as this, cleaning of the production facilities was often made difficult by these features in the past.

HEW hygiene motors now solve these problems. With these new special motors from HEW, the housing is designed as a completely smooth, closed surface, which has no edges, depressions or grooves. They are therefore very easy to clean and reduce the growth of pathogens and bacteria on their surfaces. The motors are optionally available in V2A stainless steel or aluminium versions. The stainless steel motors are available in a non-ventilated version (IC410 TENV Totally Enclosed Non Ventilated) and in a liquid-cooled version (IC 3S7 TELC Totally Enclosed Liquid Cooled). The electrical connections and the supply and return connections for liquid cooling are located opposite the drive side. For additional information regarding the used coolant, please refer to the respective maintenance and operating instructions.

Technical specification:

- Smooth surface
- Low surface temperature with liquid cooling < 60°C
- No fan, purely convection or liquid cooling
- Available in stainless steel or aluminium housing versions
- Motor outputs from 0.18 kW - 2.2 kW
- Motor protection class IP 66
- Motor protection optionally with PTC or thermostatic switch
- Low friction PTFE rotary shaft seal in hygienic design
- Optional rotary encoder for inverter operation
- Connection optionally via motor cable or IP66 plug connector
- Shaft end made of stainless steel; other materials on request
- Motors with specially dimensioned motor shafts (direct gear mounting) are available on request

The HEW hygiene motors offer optimum protection against:

- Moisture
- Cleaning agents
- Oils
- Soiling
- Chemicals
- Bacteria
- Temperature fluctuations
- Water jets

Electrical data and dimension sheets of hygiene motors in aluminium version are available on request.

**Explosion protected motors,
series R3G + R3D**

15

Three-phase motors

EXPLOSION-PROTECTED ELECTRIC MOTORS

For dimensional sheets see page 15/11.

Explosion-protected electric motors R3G + R3D

HEW series R3D and R3G were specially developed for applications in explosive environments. Motors of ignition protection type II 3G Ex nA IIC T3-T4 Gc (equipment for Zone 2) are exclusively available as stand-alone motor, motors of ignition protection type II 3 D Ex tc IIIB T135°C Dc (equipment for Zone 22) are available as stand-alone and brake motor. The drives are available as 2-pole, 4-pole, 6-pole and 8-pole versions; pole-changing versions are available on request. With regard to design, the dust-protected brake motors (equipment for Zone 22) match the standard brake motors of series R (see Parts 10, at least protection class IP55). The magnet section of the brake was optimised in order to comply with the explosion protection requirements.

Applicable ignition protection types for electrical machines of type R3G + R3D

Ignition protection type Code letter	Specification	Protection notion	Application with type of electrical machine
Ignition protection type "n"	DIN EN 60079-15 Equipment for zone 2	No sparks, arcs or impermissible temperatures occur during operation. If sparks, arcs or impermissible temperatures occur inside the equipment, the housings and the terminal box have to be of protection class IP54 requiring more than 30 seconds to drop by 2 mbar at an overpressure of 4 mbar (gas-proof), or housings and terminal boxes are pressurised in a simple way.	All motor types, e.g.: - squirrel-cage motors - slip ring motors - collector motors etc. with motor protection switch and overpressure monitoring. Prevent sparks formed during operation from escaping. Manufacturer's information regarding these measures.
Dust protection "t"	DIN EN 60079-31 Equipment for zone 22	This type of ignition protection is based on a restriction of the maximum temperature of the housing surface and restriction of dust ingress by using "dust-proof" housings.	All electrical motors featuring protection by housings with restricted surface temperature.

Gas - explosion protection

Ignition temperature - temperature class

The ignition temperature depends on many factors such as surface size, shape, type and characteristics. In IEC 60079-20-1, IEC; CENELEC and other standardisation committees agreed upon a defined procedure of determining the ignition temperature closely approaching the lowest practically possible value.

Gases and vapours are accordingly divided into temperature classes. Complying with these temperature classes, the surface temperatures of electrical equipment and other technical devices are designed such that an ignition due to the surface temperature is impossible. The standards set out the permissible exceedances and compulsory lower deviations from these control values.

Temperature class	Ignition temperature range of the mixture	Permissible surface temperature of electrical equipment	Permissible temperature rise
T1	> + 450 °C	+ 400 °C	+ 410 °C
T2	> + 300...≤ + 450°C	+ 300 °C	+ 260 °C
T3	> + 200...≤ + 300°C	+ 200 °C	+ 160 °C
T4	> + 135...≤ + 200°C	+ 135 °C	+ 95 °C

Dust - explosion protection

Surface temperature - protection class

The IP protection class is a major feature of the dust explosion protection. Depending on the ambient conditions, there are different dust tightness requirements on the motor. Another key measure for dust explosion protection is to restrict the surface temperature of the motors to a value lying below the ignition and smouldering temperature of the dust in question.

Application location	Presence of an explosive dust atmosphere	rarely or briefly	rarely or briefly
	Dust type	Conductive*	Non-conductive
	Zone	22	22
Equipment	Device group	III	III
	Device category	3D	3D
	Sub-groups	IIIC / IIIB / IIIA	IIIB / IIIA
	Protection class	IP6X	IP5X
	Housing temperatures	max. 135°C	max. 135°C
	Certificate	EC Declaration of Conformity of the manufacturer	EC Declaration of Conformity of the manufacturer

* The R3D (Zone 22) series motors are not available for group IIIC "conductive dust".

Permissible use of motors according to their labelling depending of the assignment of zones

Device group	Device category	Assignment of zones	Definition acc. to BetrSichV [Ordinance on Industrial Safety and Health]	Obligation of certification
For combustible gases, vapours and mists				
II	1G*	0	Zone 0 comprises areas where an explosive atmosphere consisting of a mixture of air and gases, vapours and mists is present permanently, for an extended period of time or frequently.	Yes
II	2G	1	Zone 1 comprises areas where an explosive atmosphere consisting of a mixture of air and gases, vapours and mists occurs sometimes.	Yes
II	3G	2	Zone 2 comprises areas where an explosive atmosphere consisting of a mixture of air and gases, vapours and mists is unlikely to occur; if it does occur, this will by all probability happen only very rarely and for a short period of time only.	No
For inflammable dust				
II	1D*	20	Zone 20 comprises areas where an explosive atmosphere consisting of a mixture of air and gases is present permanently, for an extended period of time or frequently.	Yes
II	2D	21	Zone 21 comprises areas where an explosive atmosphere consisting of a mixture of air and gases occurs sometimes.	Yes
II	3D	22	Zone 22 comprises areas where an explosive atmosphere consisting of swirled dust is unlikely to occur; if it does occur, this will by all probability happen only very rarely and for a short period of time only.	No

*unusual for electric motors

Maintaining the explosion protection

Maintaining the explosion protection during operation:

Electrical machines have to be protected against overheating caused by overloading. The motor protection depends on the operating mode and also on the electrical machine and its use.

The systems monitoring the motors have to comply with the requirements of directives 94/9/EC and EN 1127-1.

Operating mode	Motor protection
S1	Motor protection switch acc. to DIN EN 60034-1; DIN EN 60079-14 Motor protection switch and temperature sensor in the winding as additional protection
S2	Motor protection switch runtime timer and/or temperature sensor in the winding as additional protection. Master protection device: only temperature sensor in the winding (permissible only with approved controllers/triggering devices)
S3 – S10*	Master protection device: only temperature sensor in the winding (permissible only with approved controllers/triggering devices)

Definition of operating modes acc. to DIN EN 60034-1

* Motors of type R3G (Zone 2) may be operated on a frequency inverter only if the requirements of DIN EN 60079-15 / Part 8.10.2 are complied with.

Subject to technical amendments

Three-phase motors

Explosion protected brake motors – surface cooling, cooling type IC411 (internal ventilation)

Types R3... 63 K – 180 L

Equipment for Zone 2 and Zone 22

Protection class ≥ IP55

Design B3 *

1) See Planning section, page 1/12

2) With lifting eye from size 112 onward

Fits and tolerances see page 8/2

* Design IM B14 / IM 3601, IM V18 / IM 3611, IM V19 / IM 3631 (see page 1/5)

Three-phase motors

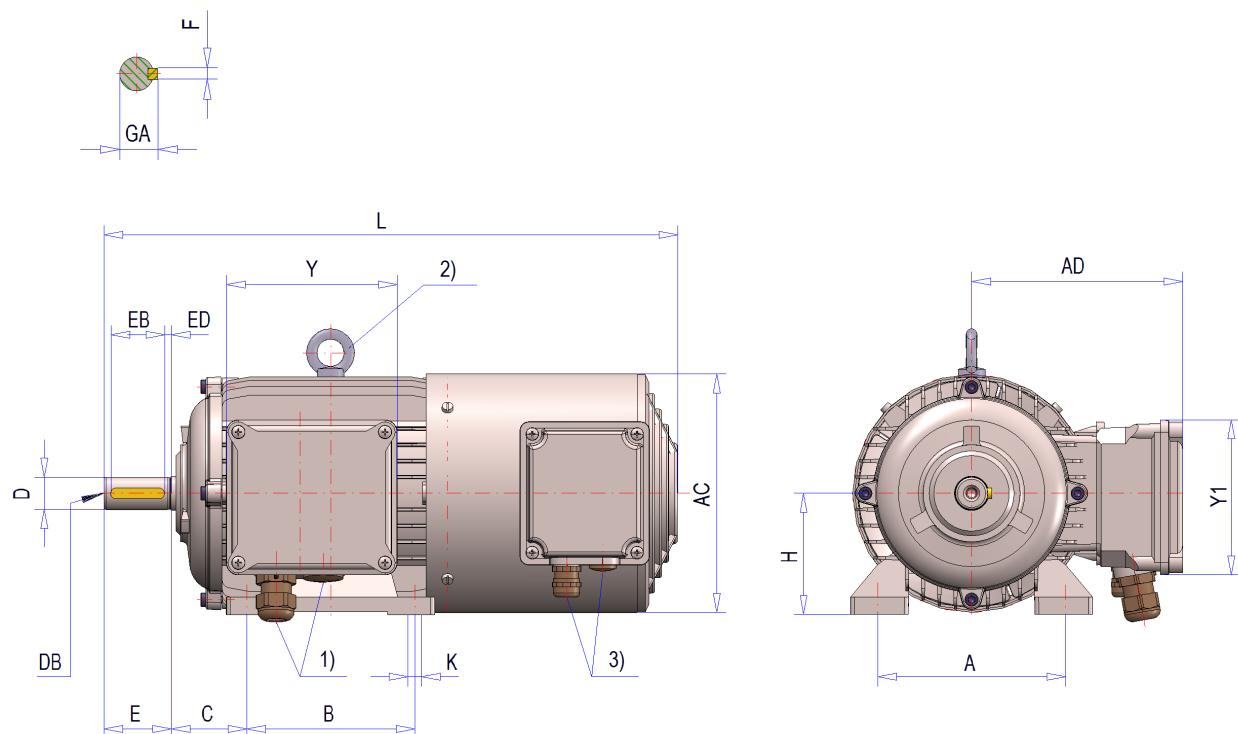

Explosion protected electric motors – surface cooling, cooling type IC416 (external ventilation)

Types R3... 63 K – 180 L

Equipment for Zone 2 and Zone 22

Protection class ≥ IP55

Design B3 *

1) See planning section page 1/12

2) With lifting eye from size 112 onward

3) 1x cable gland M16x1.5 / 1x plug screw M16x1.5

Fits and tolerances see page 8/2
Subject to technical amendments

Overview of HEW production line

HEW has been producing asynchronous motors for more than 120 years. Our product line comprises the following variants:

- **Explosion-protected 3-phase motors**
- **Explosion-protected 3-phase brake motors**
- Standard three-phase motors (see catalogue part Model series R)
- Standard pole-changing three-phase motors (see catalogue part Model series R)
- Standard pole-changing three-phase fan drives (see catalogue part Model series R)
- Reluctance motors (see catalogue part Model series R)
- Single-phase motors (see catalogue part Model series R)
- Brake motors (see catalogue part Model series R)
- Rotating field motors (see catalogue part Model series R)
- Submersible motors (see catalogue part Model series R)
- Hygiene motors (see catalogue part Model series R)
- **Explosion protected three-phase motors for use in Zone 2**(see catalogue part Model series R)
- **Explosion protected three-phase (brake) motors for use in Zone 22**(see catalogue part Model series R)

Due to their high-quality insulation system, our motors are suited for inverter operation.

As a rule, they are manufactured in thermal class F and come with a PTC (other temperature sensors are available on request).

Operating three-phase motors in demanding drive systems often requires feedback elements to be fitted. On customer's request, HEW also supplies the motors with incremental encoders from various manufacturers. Explosion-protected three-phase motors or three-phase brake motors can be equipped with such encoders.

Standard motors come in protection class IP 55. Higher protection levels are available on request (see page 16/8).

Versions in compliance with other standards or guidelines (e.g. Gost R, VIK or GL) are available on request.

Primer/paint

HEW motors are provided with a primer as standard. The primer is a low-solvent two-component polyacrylic product. The quick-drying primer coat can be applied as an undercoat, primer or primer filler to all metallic surfaces.

On customer's request, the motors are available with a two-component polyacrylic paint (acc. to RAL table). Special paint coats for extreme environmental conditions are also available on request.

Ignition protection types of electrical machines

Ignition protection type Code letter	Standard	Protection notion	Application with type of electrical machine
Pressurised encapsulation "d"	DIN EN 60079-1 Equipment for Zone 1+2	All parts which are ignition sources are contained in a pressure-tight housing whose the seal is a spark-proof gap, so that an explosion in an explosive atmosphere inside the housing will not be transferred to the surrounding explosive atmosphere.	All motor types, e.g.: - squirrel cage motors - slip ring motors - collector motors For all operating modes S1 to S10, for all aggravated start-up conditions and speed-controlled drives
Increased safety "e"	DIN EN 60079-7 Equipment for Zone 1+2	In this context, measures have to be taken that safely prevent the formation of sparks, arcs and impermissible heat provided the equipment is operated properly and as intended.	Only squirrel cage motors with appropriately adjusted motor protection switch. The specified t_E times have to be complied with.
Ignition protection type "n"	DIN EN 60079-15 Equipment for zone 2	No sparks, arcs or impermissible temperatures occur during operation. If sparks, arcs or impermissible temperatures occur inside the equipment, the housings and the terminal box have to be of protection class IP54 requiring more than 30 seconds to drop by 2 mbar at an overpressure of 4 mbar (gas-proof), or housings and terminal boxes are pressurised in a simple way.	All motor types, e.g.: Squirrel cage motors - slip ring motors - collector motors etc. with motor protection switch and overpressure monitoring. Prevent sparks formed during operation from escaping. See the manufacturer's information regarding these measures.
Dust protection "t"	DIN EN 60079-31 Equipment for Zone 21+22	This type of ignition protection is based on a restriction of the maximum temperature of the housing surface and restriction of dust ingress by using "dust-proof" or "dust protected" housings.	All electrical motors featuring protection by housings with restricted surface temperature.

Gas - explosion protection

Ignition temperature - temperature class

The ignition temperature depends on many factors such as surface size, shape, type and characteristics. In IEC 60079-20-1, IEC; CENELEC and other standardisation committees agreed upon a defined procedure of determining the ignition temperature closely approaching the lowest practically possible value.

Gases and vapours are accordingly divided into temperature classes. Complying with these temperature classes, the surface temperatures of electrical equipment and other technical devices are designed such that an ignition due to the surface temperature is impossible. The standards set out the permissible exceedances and compulsory lower deviations from these control values.

The standard motors comply with the highest IIC group and temperature class T4 that include all lower groups and temperature classes. Motors of temperature class T4 have – with regard to size – the same power as standard motors not protected against explosion. The motors are also available in temperature classes T5 and T6 on request. In this case, the nominal power may have to be adapted to account for the permissible housing temperature.

Temperature class	Ignition temperature range of the mixture	Permissible surface temperature of electrical equipment	Permissible temperature rise
T1	> + 450 °C	+ 400 °C	+ 410 °C
T2	> + 300...≤ + 450°C	+ 300 °C	+ 260 °C
T3	> + 200...≤ + 300°C	+ 200 °C	+ 160 °C
T4	> + 135...≤ + 200°C	+ 135 °C	+ 95 °C
T5	> + 100...≤ + 135°C	+ 100 °C	+ 60 °C
T6	> + 85...≤ + 100°C	+ 85 °C	+ 45 °C

Examples of gases and vapours to temperature classes and explosion subgroups assignment

	T1	T2	T3	T4	T5	T6
IIA	Methane	Propane	Benzine	Acetaldehyde		
IIB		Ethylene	Diethyl ether			
IIC	Hydrogen	Acetylene				Carbon disulphide

Dust - explosion protection

Surface temperature - protection class

The IP protection class is a major feature of the dust explosion protection. Depending on the ambient conditions, there are different dust tightness requirements on the motor. Another key measure for dust explosion protection is to restrict the surface temperature of the motors to a value lying below the ignition and smouldering temperature of the dust in question.

Application location	Presence of an explosive dust atmosphere	occasionally	rarely or briefly	rarely or briefly
	Dust type	all types	Conductive	Non-conductive
	Zone	21	22	22
Equipment	Device group	II	II	II
	Device category	2D	3D	3D
	Protection class	IP6X	IP6X	IP5X
	Temperature Housing temperatures	max. 135°C	max. 135°C	max. 135°C
	Certificate	EC-type examination certificate of testing facility	EC Declaration of Conformity of the manufacturer	EC Declaration of Conformity of the manufacturer

Permissible use of motors according to their labelling depending of the assignment of zones

Device group	Device category	Assignment of zones	Definition acc. to BetrSichV [Ordinance on Industrial Safety and Health]	Obligation of certification
For combustible gases, vapours and mists				
II	1G*	0	Zone 0 comprises areas where an explosive atmosphere consisting of a mixture of air and gases, vapours and mists is present permanently, for an extended period of time or frequently.	Yes
II	2G	1	Zone 1 comprises areas where an explosive atmosphere consisting of a mixture of air and gases, vapours and mists occurs sometimes.	Yes
II	3G	2	Zone 2 comprises areas where an explosive atmosphere consisting of a mixture of air and gases, vapours and mists is not likely to occur. If it does occur, then in all probability only seldom and for a short period.	No
For inflammable dust				
II	1D*	20	Zone 20 comprises areas where an explosive atmosphere consisting of a mixture of air and gases is present permanently, for an extended period of time or frequently.	Yes
II	2D	21	Zone 21 comprises areas where an explosive atmosphere consisting of a mixture of air and gases occurs sometimes.	Yes
II	3D	22	Zone 22 comprises areas where an explosive atmosphere consisting of swirled dust is not likely to occur. If it does occur, then in all probability only very seldom and for a short period.	No

*unusual for electric motors

Maintaining the explosion protection

Maintaining the explosion protection during operation:

Electrical machines have to be protected against overheating caused by overloading. The motor protection depends on the operating mode and also on the electrical machine and its use.

The systems monitoring the motors have to comply with the requirements of directives 94/9/EC and EN 1127-1.

Operating mode	Motor protection
S1	Motor protection switch acc. to DIN EN 60034-1; DIN EN 60079-14 Motor protection switch and temperature sensor in the winding as additional protection
S2	Motor protection switch runtime timer and/or temperature sensor in the winding as additional protection. Master protection device: only temperature sensor in the winding (permissible only with approved controllers/triggering devices)
S3 – S10	Master protection device: only temperature sensor in the winding (permissible only with approved controllers/triggering devices)

Definition of operating modes acc. to DIN EN 60034-1

Explosion-protected electric motors

Explosion-protected (pressure-proof encapsulated) motors are used in industrial plants where atmospheres containing explosive, flammable vapours, gases or dusts can occur (e.g. in the chemical industry, oil refineries, etc.).

They are 3-phase asynchronous motors with squirrel cage rotor acc. to DIN EN 60079 (gas explosion protection) and (dust explosion protection).

The motor housings are pressure-proof enclosures acc. to DIN EN 60079-1. The terminal boxes can be "pressure-proof encapsulated" acc. to DIN EN 60079-1 or with "increased safety" acc. to DIN EN 60079-7.

The following standards and regulations were used to design, produce and test the electric motors:

Title (Rotating electrical machines)	IEC international	EN-CENELEC Europe	DIN Germany
Rating and operating behaviour	IEC 60034-1	EN 60034-1	DIN EN 60034-1
Degrees of protection provided by integral design of rotating electrical machines (IP code) - Classification	IEC 60034-5	EN 60034-5	DIN EN 60034-5
Methods of cooling (IC code)	IEC 60034-6	EN 60034-6	DIN EN 60034-6
Classification of types of construction, mounting arrangements and terminal box position (IM Code)	IEC 60034-7	EN 60034-7	DIN EN 60034-7
Connection designations and direction of rotation	IEC 60034-8	EN 60034-8	DIN EN 60034-8
Noise level limits	IEC 60034-9	EN 60034-9	DIN EN 60034-9
Starting performance of three-phase cage induction motors except pole-changing motors	IEC 60034-12	EN 60034-12	DIN EN 60034-12
Mechanical vibration of certain machines with shaft heights 56 mm and higher - Measurement, evaluation and limits of vibration severity	IEC 60034-14	EN 60034-14	DIN EN 60034-14
Efficiency classes of single-speed, three-phase, cage-induction motors (IE code)	IEC 60034-30	EN 60034-30	DIN EN 60034-30
Three-phase asynchronous motors for general applications with standardised dimensions and power ratings	IEC 60072-1 *	EN 50347 *	DIN EN 50347 *
Electrical equipment for explosive atmospheres - General requirements	IEC 60079-0	EN 60079-0	DIN EN 60079-0
Electrical equipment for explosive atmospheres - Pressure-proof encapsulation "d"	IEC 60079-1	EN 60079-1	DIN EN 60079-1
Electrical equipment for explosive atmospheres - Increased safety "e"	IEC 60079-7	EN 60079-7	DIN EN 60079-7
Electrical equipment for use in areas with combustible dust - Protection by housing	IEC 60079-31	EN 60079-31	DIN EN 60079-31

* Applies to dimensions and sizes only

Mechanical design

Designs

Overview of design and IM code (international mounting) of the most frequently used versions acc. to DIN EN 60034-7.

horizontal shaft		vertical shaft		vertical shaft	
IM Code I	IM Code II	IM Code I	IM Code II	IM Code I	IM Code II

IM B34	IM 2101	IM V17	IM 2111	IM V37	IM 2131

IM B6		IM 1051
IM B7		IM 1061
IM B8		IM 1071

Designs

The designs of electric motors and their symbols comply with DIN EN 60034-7. Our motors are available in basic designs IM B3; IM B5 and IM B14.

The table on page 16/8 shows the symbols and possible configurations of the standard models we manufacture. The motors of type IM B3 can also be operated in mounting positions IM B6, IM B7 and IM B8. In addition to standard flange sizes, a great number of other flange sizes is also available (see page 1/10).

Vertical designs with the shaft end at the bottom or top must be protected against water drops or foreign bodies that could fall into the motor. Designs with the shaft end pointing down are usually protected with a roof. But this protection is not required if the machine features such a protective cover.

Motors installed outside have to be protected against direct sun irradiation.

IP protection classes

DIN EN 60034-5 identifies the protection classes of rotating electrical machines with a code comprised of the code letters IP (International Protection) and two code numbers.

1st code number (0 to 6): protection levels for protection against contact and foreign objects.

2nd code number (0 to 8): protection levels for protection against water.

The motors come in protection class IP 55. Motors with higher protection are also available on request.

Protection against solid foreign objects and liquids: IP protection class

Protection class	Protection against contact and penetration of solid foreign bodies (1st digit)
IP 55 / IP 56	Full protection against touching of live and moving internal parts. Protection against ingress of dust: The ingress of dust is not entirely prevented but dust cannot enter in amounts that would impair the satisfactory operation of the machine.
IP 65	Full protection against touching of live and moving internal parts. The ingress of dust is entirely prevented.

Protection class	Protection against the ingress of water (2nd digit)
IP 55 / IP 65	The motor is protected against water jets from all directions.
IP 66	Machine protected against heavy seas. Harmful amounts of water by heavy seas or water in a powerful jet must not enter the housing.

Other protection classes available on request

Housing version

Explosion protection standards applied during production and testing of motors.

Standard	IEC international	Germany/Europe
Electrical devices in explosive areas Standard version	IEC 60079-0	DIN EN 60079-0
Electrical devices for operation in explosive areas Pressurised encapsulation "d"	IEC 60079-1	DIN EN 60079-1
Electrical devices for operation in explosive areas Increased safety "e"	IEC 60079-7	DIN EN 60079-7

Construction

The electric motors are fully encapsulated and have an internal fan. Cooling occurs by ambient air the fan blows over the outer ribbed surface (cooling system IC 411 acc. to DIN EN 60034-6). Motors up to size 250 come with a cast iron housing. From size 280 onward, welded housings and cast iron terminal boxes are used.

Flange variants

To ensure short delivery times, all motor types of sizes 63 to 250 were designed with screwed flanges and/or feet. This also makes it possible to build all designs possible acc. to DIN EN 60034-7 using a basic motor.

Available flanges

Other flange variants available on request

Note

- 1) New designation of as per DIN EN 50347
- 2) Old designation as per DIN 42948

Storage

The following table lists the bearings used in each of the motors. The bearings of motors with 4, 6 and 8-poles have a service life of approx. 20 000 hours unless the load values specified in the tables on pages 16/13 and 16/14 are not exceeded.

Only bearings made by renowned manufacturers are installed. If desired by the customer, we also install other bearing types and sizes in the motors (depending on the respective design).

The bearings of standard versions of sizes 63 to 250 on the drive side and the non-driving side of sizes 280 to 315 are fixed bearings.

Bearing

Size	Poles	DS bearing	NS bearing	Sealing ring
63	2-8	6202 2Z C3	6202 2Z C3	12 x 32 x 7
71	2-8	6203 2Z C3	6203 2Z C3	17 x 40 x 7

315	2-8	6317 2Z C3	6317 2Z C3	85 x 115 x 13

Motors of size 160 and onward with roller bearings are available

Motors with insulated bearings are available

Shaft ends

The shaft ends are cylindrical and their design complies with DIN EN 50347; their assignment to sizes and power complies with DIN 42673 Part 3.

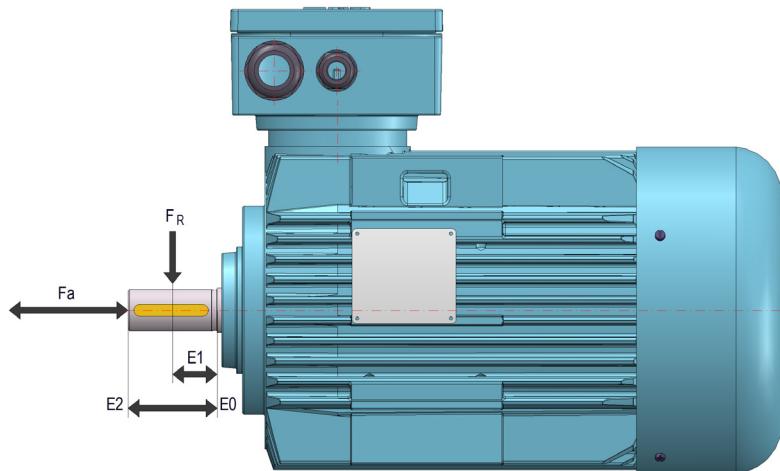

The DS shaft end of all motors has a centre bore acc. to DIN 332 Part 2 shape D. The NS shaft end features a centre bore acc. to DIN 332 Part 1. The motors always come with parallel keys complying with DIN 6885 Part 1. Versions with a second free shaft end are available on request.

- up to a diameter of 50 mm – ISO k6
- 50 mm and more – ISO m6

Shaft diameter	11 mm	14 mm	19 mm	24 mm	28 mm	38 mm	From 42 to 48 mm	From 55 to 80 mm
Internal thread	M5	M5	M6	M8	M10	M12	M16	M20

Radial and axial forces

Permissible loads on the free shaft end

The nominal load of the bearings has been calculated for a minimum service life of 20 000 hours at a frequency of 50 Hz. Only axial loads were considered. The service life of the bearings is shorter when a combination of axial and radial loads is present.

Maximum radial load

Unit arrangement	Maximum load on the free shaft end F_a [kN]

Bearing lubrication

The standard version motors are fitted with permanently lubricated bearings.

Any deviation from the nominal operating temperature affects the service life of the motor bearings.

(Heed the manufacturer's recommendations for extreme operating conditions)

Motors with regreasing device:

Motors of size 160 and above can be fitted with a regreasing device. The specified regreasing intervals and grease types have to be heeded for these motors. After regreasing, the motor should be run without load to distribute the grease.

The effectiveness of proper bearing greasing should be tested by measuring the bearing cover temperature of the running motor.

The regreasing intervals have to be shortened if the measured temperature exceeds + 80 °C. Regreasing intervals should be halved for every 15 K of temperature rise. If this is impossible, special lubricants for very high operating temperatures should be used.

Lubricating the ball bearings - intervals in operating hours

Size	Quantity of grease [g]	Speed [rpm]

Three-phase motors

Ex e type terminal boxes have threaded bores (acc. to table) and pertaining Ex e cable glands.

By default, Ex d type terminal boxes come with the threaded bores (acc. to table). The cable glands are not included (other threads on request).

Terminal boxes and cable entries					
Size	Terminals For cables with maximum cross section (mm ²)	Cable entries for power cables			
		Ex e housing	Ex d housing	Threaded bore	Outer diameter of cable (mm)
63	2.5	4 x M20 x 1.5		6.5 to 12	4 x M20 x 1.5
71	2.5	4 x M20 x 1.5		6.5 to 12	4 x M20 x 1.5
80 90 100	4	1 x M25 x 1.5 1 x M20 x 1.5		13 to 18 6.5 to 12	1 x M25 x 1.5 1 x M20 x 1.5
112	4	1 x M32 x 1.5 1 x M20 x 1.5		13 to 18 6.5 to 12	1 x M32 x 1.5 1 x M20 x 1.5
132	4	2 x M32 x 1.5 1 x M20 x 1.5		13 to 18 6.5 to 12	2 x M32 x 1.5 1 x M20 x 1.5
160 180	16	2 x M40 x 1.5 1 x M20 x 1.5		22 to 32 6.5 to 12	2 x M40 x 1.5 1 x M20 x 1.5
200 225	16	2 x M50 x 1.5 1 x M20 x 1.5		32 to 38 6.5 to 12	2 x M50 x 1.5 1 x M20 x 1.5
250 280 315	95-300	2 x M63 x 1.5 1 x M20 x 1.5		37 to 44 6.5 to 12	2 x M63 x 1.5 1 x M20 x 1.5

Additional bores for cable glands are available on request.

Special motor versions (e.g. with standstill heatings) come with an additional M20 x 1.5 cable entry.

Noise and vibrations

Noise level:

The noise level of the motors is below the values DIN EN 60034-9 permits for externally cooled motors.

Maximum permissible noise level L in dB (distance of one metre to the motor surface)						
Values for surface-cooled motors						
Nominal power P [kW]	Speed [rpm]					
	600 < n ≤ 960	960 < n ≤ 1320	1320 < n ≤ 1900	1900 < n ≤ 2360	2360 < n ≤ 3150	3150 < n ≤ 3750
P ≤ 1,1	67	70	71	74	75	79
1.1 < P ≤ 2.2	69	70	73	78	80	82
2.1 < P ≤ 5.5	72	74	77	82	83	85
5.5 < P ≤ 11	75	78	81	86	87	90
11 < P ≤ 22	78	82	85	87	91	93
22 < P ≤ 37	80	84	86	89	92	95
37 < P ≤ 55	81	86	88	92	94	97
55 < P ≤ 110	84	89	92	93	96	98
110 < P ≤ 220	87	91	94	96	98	100

Vibrations:

The rotors of the motors have been dynamically balanced with fan and half of the parallel key fitted. The vibration amplitude complies with vibration severity level A (normal) acc. to DIN EN 60034-14.

Vibration limit values [mm/s] Speed [rpm] 600 to 3600				
Degrees	Machine installation	Axis height		
		56 to 132	160 to 280	315
A (normal)	free suspension	1.6	2.2	2.8
	rigid clamping	1.3	1.8	2.3
B (reduced)	free suspension	0.7	1.1	1.8
	rigid clamping	-	0.9	1.5

Electrical design

Output, voltage and frequency

The data given in section Technical Data relate to continuous operation (S1 acc. to DIN EN 60034-1) of the motors at nominal voltage, nominal frequency, max. coolant temperature + 40°C and an installation elevation ≤ 1000 m above sea level.

Voltage fluctuations up to ± 5 % and frequency fluctuations up to ± 2 % are permitted. The performance data remain unchanged and the maximum permissible winding temperature is not exceeded within these tolerances.

On request, motors with nominal voltages between 110 V and 690 V and nominal frequencies of 50 Hz or 60 Hz are available. Motors designed for 380 V, 400 V and 415 V and a frequency of 50 Hz can also be operated at 440 V and 480 V with a frequency of 60 Hz. A 15% higher load is possible in this case. The speed increases by approx. 20% while the start-up and maximum torque is by 18% lower.

The following must also be taken into consideration when selecting the best possible motor output:
required power of working machines; operating mode; start-up, braking and reversing mode, torque curve of working machine; mains conditions (FI operation); cooling, coolant temperature; installation elevation.

Heating and thermal classes

The choice of individual insulation system components determines the classification in the thermal classes in accordance with DIN EN 60034-1.

The stator windings of the motors comply with thermal class F. The stator windings are always manufactured with phase insulation as well as high-quality enamelled wire and impregnating resin. The high degree of electrical strength that this achieves is the guarantee of problem-free use of the motors on the frequency inverter.

Motors complying with thermal class H with windings for operation under extreme conditions and frequent switch-on/switch-off cycles and are also available on request.

Actuations

The windings of motors with nominal power of up to 2.2 kW are designed in 400 V star circuit. Motor with higher powers are designed in 400 V delta circuit (star-delta start). Pole-changing motors with a speed ratio of 2:1 are designed in Dahlander circuit (separate winding available on request). Other pole ratios are designed with two separate windings in star circuit.

Overload

The motors are designed such that, after having reached their operating temperature, they can be operated with the 1.5-fold load for two minutes without causing any damage.

Rotation direction

Basically, the motors are suited for both directions of rotation. The winding leads U1, V1, W1 of the motors are designed such that the motor turns in clockwise direction if they are connected to the 3-phase mains to L1, L2, L3 respectively. The motor turns counter clockwise if two outer leads are swapped (e.g. L1 with L2). The rotation direction is indicated when looking at the shaft face (DS).

Earthing and PE connection

The motors feature a PE connection in the terminal box and an additional external PE terminal on the motor housing.

Operation on the frequency converter

When operated on a frequency inverter, the speed of three-phase asynchronous motors can be set or adjusted continuously via the frequency. Careful planning is the prerequisite for optimum matching of inverter and motor.

The pressure-resistant encapsulated HEW motors may be used in the following frequency ranges.

Motor size	Permissible frequency range
63	5 Hz – 87 Hz
71 – 160	5 Hz – 100 Hz
180 – 315	5 Hz – 87 Hz

The integrated PTC must be used as a stand-alone motor protection.

The motor selection primarily depends on the desired speed range and the torque curve of the working machine. During planning, the most critical working point has to be determined. Then the motor size and the number of poles are selected. The most critical working point will often be reached at the lowest frequency because the reduced cooling capacity of the internally ventilated motor requires the torque to be reduced in relation to the nominal torque. But it can also be in field weakening operation if the motor is used in this mode.

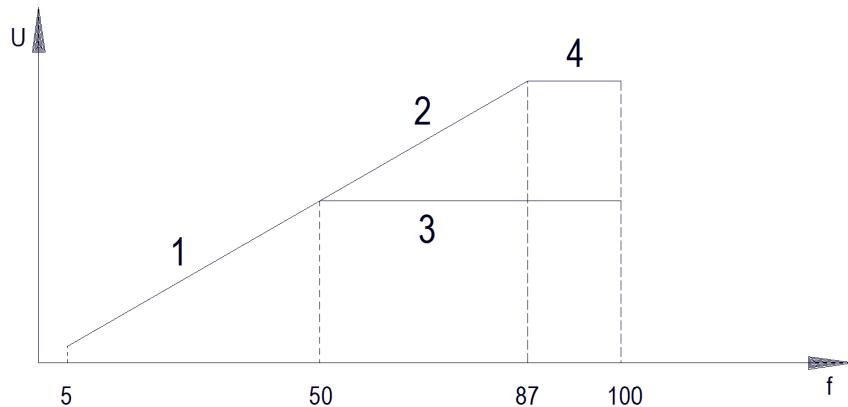

The flux remains constant and the motor operates at a constant torque (taking into account the torque reduction caused by reduced cooling with low frequencies) if the inverter voltage is increased proportionally with the frequency. We speak of field weakening operation with the motor torque decreasing at $1/f$ if the voltage remains constant and only the frequency rises (Caution: the breakdown torque decreases by the square of $1/f$).

The multitude of factors influencing inverter operation shows that careful planning is required not only to obtain smooth operation but also a cost-optimised solution.

The tables on pages 20/1 to 20/4 show the permissible torques for the typical speed ranges of motors with 2, 4, 6 and 8 poles. The operating possibility of the motors depends on the voltage version selected (230/400 V or 400/690 V).

Please do not hesitate to contact our Technical Department if you have any questions.

Schematic diagram

- | | | |
|---|-----------------------------------|---|
| 1 | U/f constant up to 50 Hz | Power rises proportional to the speed
Motor torque acc. to tables on page 20/1 to 20/4 |
| 2 | U/f constant between 50 and 87 Hz | Power rises proportional to the speed
Constant motor torque |
| 3 | U constant between 50 and 87 Hz | Power remains constant, motor torque decreases at 50/f |
| 4 | U constant between 87 and 100 Hz | Power remains constant, motor torque decreases at 87/f |

Motor protection

The motor protection has to comply with DIN EN 60079-14 and directive 94/9EC. A motor protection switch or equivalent device has to protect all poles of the motor against impermissible heating caused by overloading. An equivalent protective device would be a PTC resistor for winding temperature monitoring in conjunction with an approved triggering device, if necessary.

Exclusive protection with temperature sensor is mandatory for all operating modes other than S1, such as inverter operation, switching operation, short-term operation, heavy starting, etc. This also provides protection in case of reduced cooling air flow and/or excessively high ambient temperatures.

Standard pressure-resistant encapsulated HEW motors come with a PTC. As an option, the motors can also be equipped with additional temperature sensors such as advance warning or thermostatic switch (bimetallic sensor).

Cooling (ventilation)

All motors are equipped with a robust and temperature-resistant plastic or aluminium fan.

External ventilation (IC 416):

Motors of size 80 onward can be equipped with an optional external fan in order to increase the effective output or to comply with the temperature class in case of inverter or switching operation.

All external fans come with three-phase connection.

Installation altitude and coolant temperature

For coolant temperatures other than 40° C or installation altitudes above 1000 m above sea level, power reductions are required. In this case, the nominal power has to be corrected using the factors in the table below.

Installation altitude above sea level	Ambient temperature in °C			
	40	45	50	60
1000 m	1.00	0.96	0.92	0.82
1500 m	0.97	0.95	0.89	0.79
2000 m	0.94	0.90	0.86	0.77
2500 m	0.90	0.86	0.83	0.74
3000 m	0.86	0.82	0.79	0.70
3500 m	0.82	0.79	0.75	0.67
4000 m	0.77	0.74	0.71	0.63

In special cases, the motors can be operated without power reduction at ambient temperatures > 40°C after consultation with the manufacturer.

Standstill heating

Standstill heating against condensation:

the motors should be equipped with a standstill heater to prevent heavy condensation of the stator windings in case of great temperature deviations and load changes, e.g. periodic standstill times.

Standstill heating for low temperature operation:

For an ambient temperature of < -20°C, a standstill heating is mandatory (operation permitted up to -50°C).

The standstill heating must **not** be switched on while the motor is in operation.

Standstill heating against condensation			Standstill heating for low temperature

*Special voltage on request

Special motor version

Motors with encoder

As an option, the motors are available with hollow shaft encoder featuring the following data:

	Standard version	Special version
Make:	Kübler	Kübler
Connection:	2 m cable without plug	other cable length (without plug)
Pulses/revolution:	1024	10 – 5000
Output signal:	TTL or HTL	on request
Supply voltage:	5 V or 10-30 V	-
Type of ignition protection	II 2G Ex d IIC T6	-

Dimension sheets: See page 23.2 (motors with encoder)

Motors with motor cable

Optionally the motors can be supplied with a motor cable instead of with a terminal box. Connection to the motor occurs with a pressure-proof cable gland on the motor housing. The standard cable length is 2.0 m. Other cable lengths are available on request..

Dimension sheets: See page 23.3 (motors with motor cable)

Motors with special shaft and special flange

As an option, the motors - in particular in conjunction with a gear - are available with special flanges and special oil-tight shafts.

Dimension sheets on request

Special versions overview

As an option, the following special motor versions can also be delivered:

Motors with brake

Brake motors are three-phase asynchronous motors with squirrel cage rotor equipped with a mechanical spring-loaded brake (electrically released). The brakes come with a separate terminal box. Braking does not subject the motor winding to a thermal load. The brake motors are used for lifting and travelling drives, machine tools, packaging machines, transport and conveyor technology, servo drives, etc.

Brake motors are characterised by:

- shortening of ancillary times by reduced motor coast-down times
- locking brake in case of power failure
- exact approaching of a certain position
- increased motor switching frequency
- matching of braking torque to work conditions
- high operational safety due to robust design
- long service life

The brake motors are available with the following brake types:

- Motors with integrated brake (size 71 to 132) type BMH
- Motors with integrated brake/fan side (size 71 to 180) type KB (Kendrion)
- Motors with integrated brake/flange side (size 63 to 280) type BD (VIS)

They are exclusively intended for dry operation.

Voltage and circuit type

The brakes also available for voltages other than the standard voltages 24 V, 103 V, 180 V, and 205 V. A rectifier is used to connect the brakes to an AC supply. These rectifiers, specially developed for supplying DM solenoids, are protected with a varistor circuit against voltage peaks that occur in connection with switching, contact chatter, excessively long cables or poor mains conditions. The brake motors can be equipped with one-way or bridge rectifiers located in the terminal box.

Brake motor power data

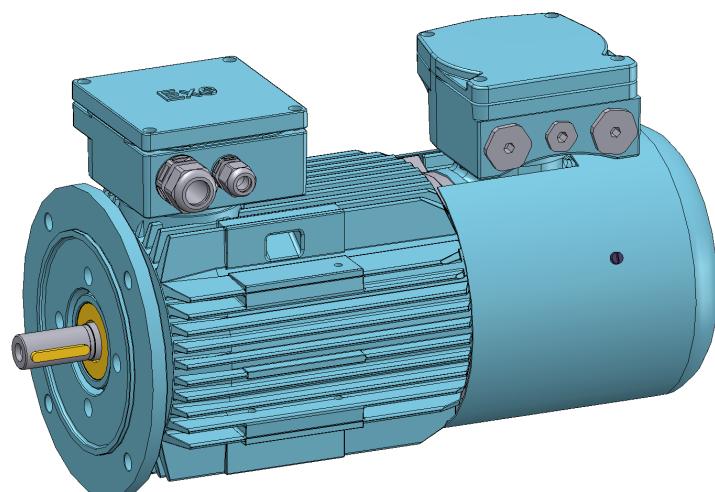

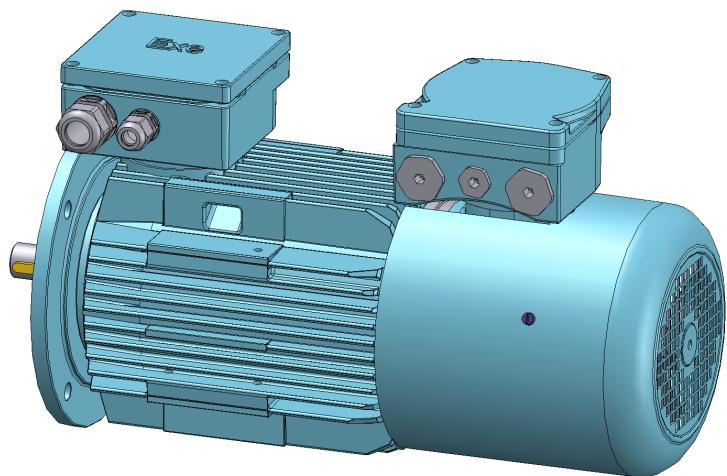

Brake size and motor size usually correspond in such a manner that the switching frequency to be obtained with the brake motor is not restricted by the brake but by the motor temperature. The permissible switching frequency calculated from the moment of inertia, counter torque and load factors can in most cases be assumed to also be the permissible brake switching frequency for the spring-loaded brake. This value must be higher than the required number of start-ups or brake procedures per hour.

Explosion-protected

three-phase brake motors

with brake/type BMH

Dimensional sheet

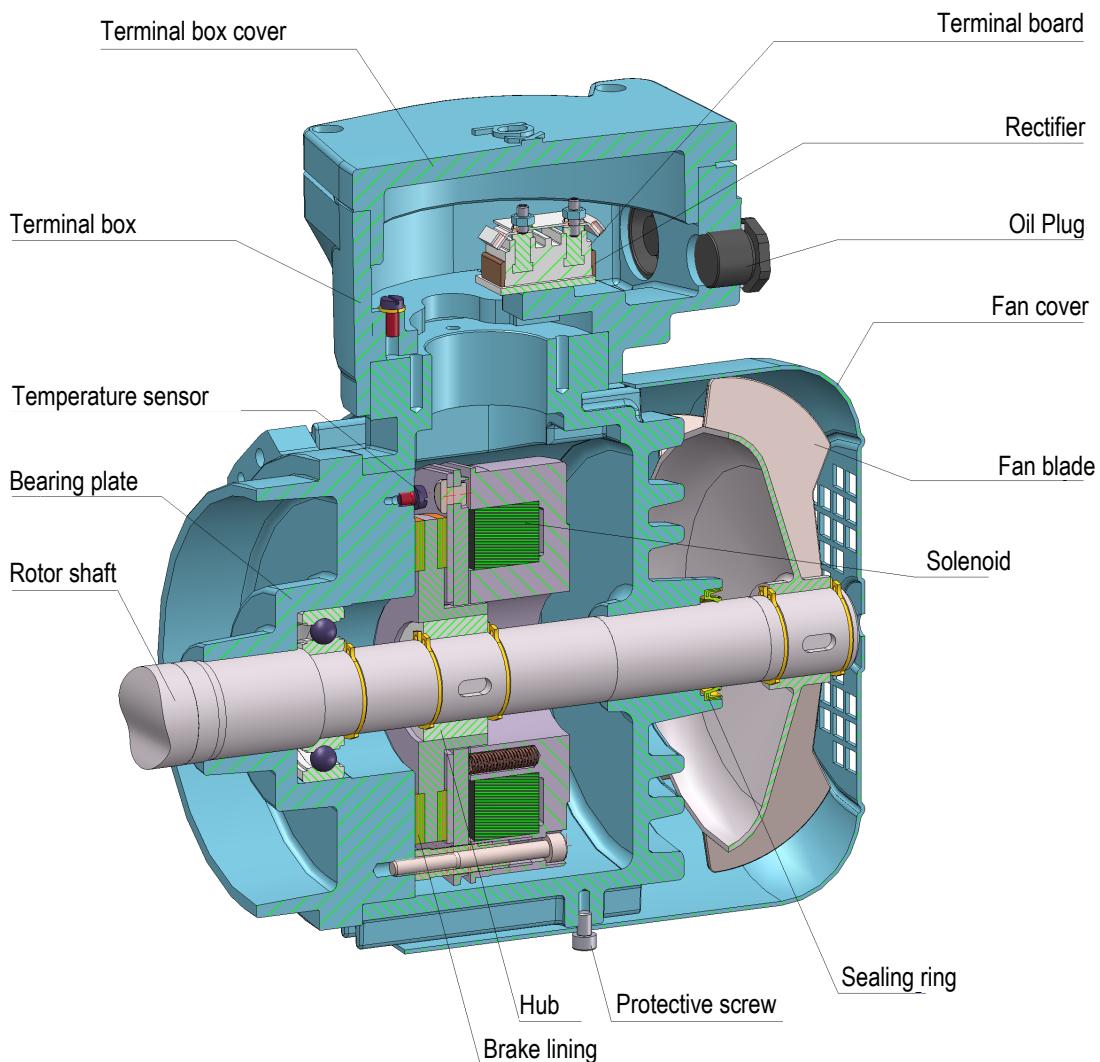

Motors with brake/type BMH

This brake is a single-disc brake with two friction surfaces. In the deenergised state, one or several pressure springs generate the braking torque by friction locking. The brake is released electromagnetically.

To release the brake, a direct current excites the solenoid of the magnet part. The resulting magnetic force pulls the armature disc against the spring force to the magnet part. The rotor is no longer subjected to the spring force and can turn freely.

Generating the braking torque

During braking, the pressure springs push the rotor axially sliding on the hub or shaft via the armature disc against the counter friction surface. When the brake is applied, there is an air gap S_{Re} between armature disc and magnet part.

Version

The brakes comply with ignition protection types II 2G Ex d IIC Gb and II 2D Ex tb IIIC Db and therefore are approved for application in Zone 1 and Zone 2, as well as Zone 21 and Zone 22. By default, the brakes are suitable for a temperature range of $-20^\circ C$ to $+40^\circ C$ (special version $-50^\circ C$ to $+60^\circ C$ available). The brakes feature a thermostatic switch for temperature monitoring.

Special designs:

- Brake motors with second shaft end
- Brake motors with additional flywheel mass

The additional flywheel mass installed in the fan cowl enables jerk-free starting and stopping of the motor.
- Brake motors with external fan

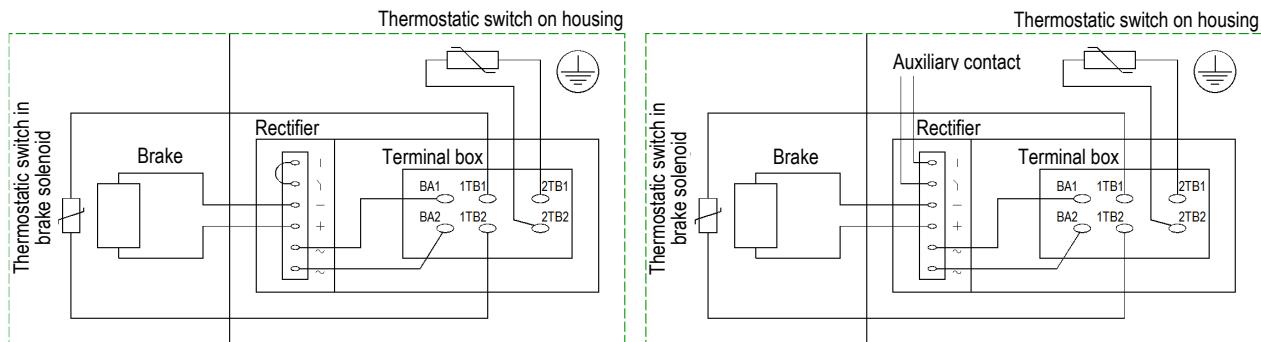

Brake motors of type "integrated brake/type BMH" come in two basic circuit variants:

AC switching

By default, the AC side of the rectifier is connected to the motor terminals, and the DC side to the brake solenoid. This results in a smooth, delayed brake engagement.

DC switching

The AC side of the rectifier is connected to the motor terminals. During switch-off, the DC circuit between rectifier and brake solenoid is interrupted with an auxiliary contact of the motor protection switch.

Special designs:

- Brakes with manual release
As an option, the brake is also available with manual release. When the manual release is actuated while the brake is deenergised, the brake releases mechanically, and the shaft can be moved easily.
- Temperature monitoring with PTC instead of with thermostatic switch

Three-phase motors

Version

The brakes comply with ignition protection types II 2G Ex d IIC T5 Gb and II 2D Ex tb IIIC T100°C and therefore are approved for application in Zone 1 and Zone 2, as well as Zone 21 and Zone 22. By default, the brakes are suitable for a temperature range of -50°C to +60°C. The brakes feature a thermostatic switch for temperature monitoring.

Special designs:

- Brakes with manual release
As an option, the brake is also available with manual release. When the manual release is actuated while the brake is deenergised, the brake releases mechanically, and the shaft can be moved easily.
- Brakes with standstill heating against condensation
- Temperature monitoring with PTC instead of with thermostatic switch
- Brake motors with second shaft end
- Brake motors with additional flywheel mass
The additional flywheel mass installed in the fan cowl enables jerk-free starting and stopping of the motor.
- Brake motors with external fan and/or hollow shaft encoder
